SYLVANIA

A Natural History

BY JOHN SMITH

The State of Ohio and the Territory of Indiana

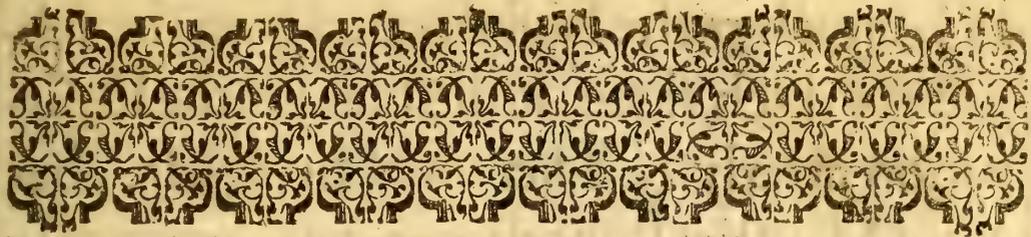

Published by the State of Ohio

in the year 1845

Price 10 Cents

Wm. B. Ewing, Printer

Columbus, Ohio

TO THE
MOST HIGH AND MIGHTY
PRINCE CHARLES,

By the Grace of GOD,

KING of *Great Britain, France, and Ireland,*

Defender of the Faith, &c.

May it please Your Most Excellent Majesty,

He vvhole Body of the Natural History, either designed or vvvritten, by the late Lord Viscount S. Alban, vvas dedicated to Your Majesty, in his Book *De Ventis*, about Four years past, vvhhen Your Majesty vvas Prince: So as there needed no nevv Dedication of this Work, but onely in all humbleness, to let Your Majesty knowv, it is Yours. It is true, if that Lord had lived, Your Majesty, ere long had been invoked to the Protection of another History, vvhwhereof, not Natures Kingdom, as in this ; but these of

Your Majesties, (during the time and Reign of King *Henry* the Eighth) had been the subject; vvhich since, it died under the Designation meerly: There is nothing left, but Your Majesties Princely goodnes, graciously to accept of the undertakers Heart and Intentions; vvhich was vvhilling to have parted for a vvhile vvvith his darling Philosophy, that he might have attended Your Royal Commandment in that other VVork. Thus much I have been bold, in all lovvlines to represent unto Your Majesty, as one that vvas trusted vvvith his Lordships VVritings, even to the last. And as this VVork affecteth the Stamp of Your Majesties Royal Protection, to make it more currant to the VVorld; so under the protection of this Work, I presume in all humbleness to approach Your Majesties presence, and to offer it up into Your Sacred Hands.

Your Majesties most Loyal

and Devoted Servant

W. RAWLEY:

TO THE
R E A D E R.

*H*aving had the Honor to be continually with my Lord, in compiling of this Work; and to be employed therein, I have thought it not amiss, (with his Lordships good leave and liking) for the better satisfaction of those that shall read it, to make known somewhat of his Lordships intentions, touching the ordering and publishing of the same. I have heard his Lordship often say, That if he should have served the glory of his own Name, he had been better not to have published this Natural History; for it may seem an indigested heap of Particulars, and cannot have that lustre which Books cast into Methods, have: But that he resolved to prefer the good of Men, and that which might best secure it, before any thing that might have relation to himself. And, he knew well, that there was no other way open to unloose Mens mindes, being bound; and (as it were) Maleficate, by the charms of deceiving Notions and Theories; and thereby made impotent for Generation of Works: But onely no where to depart from the Sense and clear experience, but to keep close to it, especially in the beginning. Besides, this Natural History was a Debt of his, being designed and set down for a third Part of the Instauration. I have also heard his Lordship discourse, That Men (no doubt) will think many of the Experiments contained in this Collection, to be Vulgar

To the Reader.

gar and Trivial, mean and sordid, curious and fruitless; and therefore he wisheth, that they would have perpetually before their eyes, what is now in doing; and the difference between this Natural History, and others. For those Natural Histories which are extant, being gathered for delight and use, are full of pleasant Descriptions and Pictures; and affect and seek after Admirations, Rarities, and Secrets. But contrariwise, the scope, which his Lordship intendeth, is to write such a Natural History, as may be fundamental to the erecting and building of a true Philosophy: For the illumination of the Understanding; the extracting of Axioms, and the producing of many noble Works and Effects. For he hopeth by this means, to acquit himself of that, for which he taketh himself in a sort bound; and that is, the advancement of Learning and Sciences. For having, in this present Work, collected the materials for the Building; and in his *Novum Organum* (of which his Lordship is yet to publish a Second Part) set down the Instruments and Directions for the Work; Men shall now be wanting to themselves, if they raise not knowledge to that perfection, whereof the Nature of Mortal Men is capable. And in this behalf, I have heard his Lordship speak complainingly, That his Lordship (who thinketh, that he deserveth to be an Architect in this Building) should be forced to be a Workman, and a Laborer; and to dig the Clay, and burn the Brick; and more then that, (according to the hard condition of the Israelites, at the latter end) to gather the Straw and Stubble, over all the Fields, to burn the Bricks withal. For he knoweth, that except he do it, nothing will be done; Men are so set to despise the means of their own good. And as for the baseness of many of the Experiments, as long as they be Gods Works, they are honorable enough: And for the vulgarness of them, true Axioms must be drawn from plain experience, and not from doubtful; and his Lordships course is to make Wonders plain, and

To the Reader.

and not plain things *Wonders*; and that experience likewise must be broken and grinded, and not whole, or as it groweth; and for Use, his Lordship hath often in his Mouth, the two kindes of Experiments, Experimenta Fructifera, and Experimenta Lucifera. Experiments of Use, and Experiments of Light: And he reporteth himself, whether he were not a strange Man, that should think, that Light hath no Use, because it hath no Matter. Further his Lordship thought good also, to add unto many of the Experiments themselves, some gloss of the Causes, that in the succeeding work of Interpreting Nature, and Framing Axioms, all things may be in more readines. And for the Causes herein by him assigned; his Lordship perswadeth himself, they are far more certain, than those that are rendered by others; not for any excellency of his own wit, (as his Lordship is wont to say) but in respect of his continual conversation with Nature and Experience. He did consider likewise, That by this Addition of Causes, Mens mindes (which make so much haste to finde out the causes of things;) would not think themselves utterly lost in a vast Wood of Experience, but stay upon these Causes (such as they are) a little, till true Axioms may be more fully discovered. I have heard his Lordship say also, That one great reason, why he would not put these Particulars into any exact Method, (though he, that looketh attentively into them, shall finde, that they have a secret order) was, Because he conceived that other men would now think that they could do the like; and so go on with a further Collection, which, if the Method had been exact, many would have despaired to attain by Imitation. As for his Lordships love of Order, I can refer any Man to his Lordships Latin Book, De Augmentis Scientiarum; which, if my judgment be any thing, is written in

To the Reader.

The Epistle
is the same,
that should
have been
prefixed to
this Book, if
his Lordship
had lived.

*the exactest order, that I know any writing to be. I will
conclude, with a usual Speech of his Lordships. That this
Work of his Natural History, is the World; as God
made it, and not as Men have made it; for that it bath
nothing, if Imagination.*

W. RAWLEY.

A

The TABLE.

A TABLE
OF THE
EXPERIMENTS.

Century I.

O f Straining or Percolation, Outward and Inward. Experiment 8.	page 1
Of Motion upon Pressure, Exp. 5	pag. 2
Of Separations of Bodies Liquid by weight. Exp. 3	pag. 3
Of Infusions in Water and Air. Exp. 7	pag. 4
Of the Appetite of Continuation in Liquids. Exp. 1	pag. 5
Of Artificial Springs. Exp. 1	pag. 6
Of the Venemous Quality of Mans Flesh. Exp. 1	ibid.
Of Turning Air into water. Exp. 1	ibid.
Of Helping or Altering the Shape of the Body. Exp. 1	pag. 7
Of Condensing of Air to yield Weight, or Nourishment. Exp. 1	ibid.
Of Flame and Air commixed. Exp. 1	pag. 8
Of the secret nature of Flame. Exp. 1	pag. 9
Of Flame in the midst and on the Sides. Exp. 1	ibid.
Of Motion of Gravity. Exp. 1	pag. 10
Of Contraction of Bodies in Bulk. Exp. 1	ibid.
Of making Vines more fruitful. Exp. 1	ibid.
Of the several Operations of Purging Medicines. Exp. 9	ibid.
Of Meats and Drinks most Nourishing. Exp. 15	pag. 12
Of Medicines applied in Order. Exp. 1	pag. 16
Of cure by Custome. Exp. 1	pag. 17
Of cure by Excess. Exp. 1	ibid.
Of Cure by Motion of Consent. Exp. 1	ibid.
Of cure of Diseases contrary to Predisposition.	ibid.
Of Preparation before and after Purging. Exp. 1	pag. 18
Of Stanching Blood. Exp. 1	ibid.
Of change of Aliments and Medicines. Exp. 1	ibid.
Of Diets. Exp. 1	pag. 19
Of Production of Cold. Exp. 7	pag. 196
Of turning Air into water. Exp. 7	pag. 20
Of Induration of Bodies. Exp. 8	pag. 22
Of Preying of Air upon water. Exp. 1	pag. 24
Of the force of Union. Exp. 1	ibid.
Of Making Feathers and Hairs of divers colours. Exp. 1	ibid.
Of Nourishment of young creatures in the Egge or womb. Exp. 1	pag. 25
Of sympathy and Antipathy. Exp. 3	ibid.
Of the Spirits or Pneumaticals in Bodies. Exp. 1	pag. 26
Of the Power of Heat. Exp. 1	pag. 27
Of Impossibility of Annihilation. Exp. 1	pag. 28

Century II.

O f Musck. Exp. 14	pag. 29
Of the Nullity and Enty of Sounds. Exp. 4	pag. 32
Of Production, Conservation, and Delation of Sounds. Exp. 14	pag. 34
Of Magnitude, Exility, and Damp of Sounds. Exp. 25	pag. 37
Of Loudness, and Softness, of Sound. Exp. 3	pag. 41

The TABLE.

Of Communication of Sounds. Exp. 3	ibid.
Of Equality and Inequality of Sounds. Exp. 9	ibid.
Of more Treble and Base Tones. Exp. 6.	pag. 43
Of proportion of Treble and Base. Exp. 4	pag. 41
Of Exteriour, Interiour Sounds. Exp. 4	pag. 45
Of Articulation of Sounds. Exp. 9.	pag. 46

Century III.

Of the Lines in which Sounds move. Exp. 6	pag. 49
Of the Lasting or Perishing of Sounds. Exp. 5	pag. 50
Of the Passage in Interception of Sounds. Exp. 5	pag. 51
Of the Medium of Sounds. Exp. 4	pag. 52
Of the Figures of Bodies yielding Sounds. Exp. 3	ibid.
Of Mixture of Sounds. Exp. 5.	pag. 53
Of Melioration of Sounds. Exp. 7	pag. 54
Of Imitation of Sounds. Exp. 6	pag. 55
Of Reflexion of Sounds. Exp. 13	pag. 56
Of Consent and Dissent between Audibles, and Visibles. Exp. 23	pag. 58
Of Sympathy and Antipathy of Sounds. Exp. 5	pag. 61
Of Hindring or Helping of Hearing. Exp. 4	pag. 62
Of the Spiritual and Fine Nature of Sounds. Exp. 4	pag. 63
Of Orient Colours in Dissolutions of Metals. Exp. 1	pag. 64
Of Prolongation of Life. Exp. 1	pag. 64
Of the Appetite of Union in Bodies. Exp. 1	ibid.
Of the like Operations of Heat and Time. Exp. 1	pag. 65
Of the Differing operations of Fire and Time. Exp. 1	ibid.
Of Motions by Imitation. Exp. 1	ibid.
Of Infectious Diseases. Exp. 1	ibid.
Of the Incorporations of Powders, and Liquors. Exp. 1.	ibid.
Of Exercise of the Body, and the Benefits or Evils thereof. Exp. 1	pag. 66
Of Meats some Glutting, or not Glutting. Exp. 1	ibid.

Century IV.

Of Clarification of Liquors, and the Accelerating thereof. Exp. 11	pag. 67
Of Maturation, and the Accelerating thereof; and of the Maturation of Drinks, and Fruits. Exp. 15.	pag. 69
Of Making Gold. Exp. 1	pag. 71
Of the Several Natures of Gold. Exp. 1	pag. 73
Of Inducing and Accelerating Putrefaction. Exp. 12	ibid.
Of Prohibiting and Preventing Putrefaction. Exp. 14	pag. 75
Of Rotten Wood shining. Exp. 1	pag. 77
Of Acceleration of Birth. Exp. 1	pag. 78
Of Acceleration of Growth and Stature. Exp. 1	ibid.
Of Bodies Sulphureous and Mercurial. Exp. 5	ibid.
Of the Chameleon. Exp. 1	pag. 80
Of Subterrany Fires. Exp. 1	ibid.
Of Nitrous water. Exp. 1	ibid.
Of Congealing of Air. Exp. 1	ibid.
Of Congealing of Water into Crystal. Exp. 1	pag. 81
Of Preserving the Smell and Colour in Rose-Leaves. Exp. 1	ibid.
Of the Lasting of Flame. Exp. 10	ibid.
Of Infusions or Burials of divers Bodies in Earth. Exp. 5	pag. 83
Of the Affects of Mens Bodies from several Winds. Exp. 1	pag. 84
Of winter and Summer Sickneses. Exp. 1	ibid.

The TABLE.

Of Pestilential Tears. Exp. 1	pag. 85
Of Epidemical Diseases. Exp. 1	ibid.
Of Preservation of Liquors in wells or Vaults. Exp. 1	ibid.
Of Stutting. Exp. 1	ibid.
Of sweet Smells. Exp. 4	pag. 86
Of the Goodness and Choice of waters. Exp. 7	ibid.
Of Temperate Heats under the Equinoctial. Exp. 1	pag. 87
Of the Coloration of Black and Tawney Moors. Exp. 1	ibid.
Of Motion after the Instant of Death. Exp. 1	pag. 88

Century V.

Of Accelerating or Hastening forward Germination. Exp. 12	pag. 89
Of Retarding or putting back Germination. Exp. 9	pag. 92
Of Meliorating, or making better, Fruits and Plants. Exp. 55	pag. 93
Of Compound Fruits, and Flowers. Exp. 55	pag. 100
Of Sympathy and Antipathy of Plants. Exp. 19	pag. 101
Of making Herbs and Fruits Medicinable. Exp. 2	pag. 104

Century VI.

Of Curiosities about Fruits and Plants. Exp. 17	pag. 107
Of the Degenerating of Plants; and of their Transmutation one into another. Exp. 14	pag. 110
Of the Procerity and Lowness of Plants; and of Artificial dwarfing them. Exp. 5	pag. 138
Of the Rudiments of Plants; and of the Excrescences of Plants, or super-Plants. Exp. 36	ibid.
Of Producing perfect Plants without Seed. Exp. 11	pag. 117
Of Forrain Plants. Exp. 3	pag. 118
Of the Seasons of several Plants. Exp. 6	pag. 119
Of the Lasting of Plants. Exp. 5	pag. 120
Of several Figures of Plants. Exp. 3	pag. 121
Of some Principal differences in Plants. Exp. 4	ibid.
Of all Manner of Composts and Helps for Ground. Exp. 6	pag. 122

Century VII.

Of the Affinities and Differences between Plants, and bodies Inanimate. Exp. 6.	pag. 125
Of Affinities and Differences between Plants, and Living Creatures; And of the Considers and Participles of Both. Exp. 3	pag. 126.
Of Plants Experiments Promiscuous. Exp. 67	pag. 127
Of Healing of worms. Exp. 1	pag. 139
Of Fat diffused in Flesh. Exp. 1	ibid.
Of Ripening Drink speedily. Exp. 1	ibid.
Of Pilosity and Plumage. Exp. 1.	ibid.
Of the Quickness of Motion in Birds. Exp. 1	ibid.
Of the Clearness of the Sea, the North wind blowing. Exp. 1	ibid.
Of the different heats of Fire and boiling water. Exp. 1	pag. 140
Of the Qualification of heat by Moisture. Exp. 1	ibid.
Of Yawning. Exp. 1	ibid.
Of the Hiccoughs. Exp. 1	ibid.

of

The TABLE.

Of Sneezing. Exp. 1	ibid.
Of the Tenderness of the Teeth. Exp. 1	pag. 141
Of the Tongue. Exp. 1	ibid.
Of the Mouth out of Taste. Exp. 1	ibid.
Of some Prognosticks of Pestilential Seasons. Exp. 1	ibid.
Of special Simples for Medicines. Exp. 1	ibid.
Of Venus. Exp. 3	142
Of the Insecta, or Creatures bred of Putrefaction. Exp. 1	pag. 142
Of Leaping. Exp. 1	pag. 145
Of the Pleasures and Displeasures of Hearing, and of the other Senses. Exp. 1	ibid.

Century VIII.

O f Veins of Earth Medicinall. Exp. 1	pag. 147
Of Sponges. Exp. 1	ibid.
Of Sea-fish in fresh waters. Exp. 1	ibid.
Of Attraction by similitude of substance. Exp. 1	pag. 148
Of certain Drinks in Turkey. Exp. 1	ibid.
Of Sweat. Exp. 6	ibid.
Of the Glo-worm. Exp. 1	pag. 149
Of the Impressions upon the Body, from several Passions of the Mind. Exp. 10	ibid.
Of Drunkenness. Exp. 4	pag. 152
Of the Hurt, or Help of wine taken moderately. Exp. 1	pag. 153
Of Caterpillars. Exp. 1	ibid.
Of the Flies Cantharides. Exp. 1	pag. 161
Of Lassitude. Exp. 2	pag. 154
Of casting the Skin and Shell in some Creatures. Exp. 1	ibid.
Of the Postures of the Body. Exp. 3	ibid.
Of Pestilential years. Exp. 1	pag. 155
Of some Prognosticks of hard Winters. Exp. 1	ibid.
Of certain Medicines that condense and relieve the Spirits. Exp. 1	ibid.
Of Paintings of the Body. Exp. 1	ibid.
Of the use of Bathing and Anointing. Exp. 1	pag. 156
Of Chamolletting of Paper. Exp. 1	ibid.
Of Cuttle-Ink. Exp. 1	ibid.
Of Earth increasing in weight. Exp. 1	ibid.
Of Sleep. Exp. 3	ibid.
Of Teeth and Hard substances in the Bodies of Living Creatures. Exp. 11	pag. 157
Of the Generation, and Bearing of living Creatures in the womb. Exp. 3	pag. 159
Of species Visible. Exp. 2	pag. 160
Of Impulsion and Percussion. Exp. 3	ibid.
Of Titilation. Exp. 1	pag. 161
Of scarcity of Rain in Egypt. Exp. 1	ibid.
Of Clarification. Exp. 1	pag. 162
Of Plants without leaves. Exp. 1	ibid.
Of the materials of Glass. Exp. 1	ibid.
Of Prohibition of Putrefaction, and the long conservation of Bodies. Exp. 1	ibid.
Of Abundance of Nitre in certain Sea-shores. Exp. 1	pag. 163
Of Bodies born up by water. Exp. 1	ibid.
Of Fuel consuming little or nothing. Exp. 1	ibid.
Of cheap Fuel. Exp. 1	pag. 164
Of Gathering of wind for Freshness. Exp. 1	ibid.
Of Trials of Aires. Exp. 1	ibid.
Of Encreasing Milk in Milch-Beasts. Exp. 1	ibid.
Of Sand of the Nature of Glass. Exp. 1	ibid.
Of the Growth of Corral. Exp. 1	pag. 165
Of the Gathering of Manna. Exp. 1	ibid.

The TABLE.

Of Correcting of wines. Exp. I	ibid.
Of Bitumen one of the Materials of Wild-fire. Exp. I	ibid.
Of Plaster growing as hard as Marble. Exp. I	ibid.
Of the Cure of some ulcers and Hurts. Exp. I	pag. 166
Of the Healthfulness or Unhealthfulness of the Southern wind. Exp. I	ibid.
Of wounds made with Brass or with Iron, Exp. I	ibid.
Of Mortification by Cold. Exp. I	ibid.
Of weight. Exp. I	ibid.
Of super-Natation of Bodies. Exp. I	ibid.
Of the Flying of unequal Bodies in the Air. Exp. I	pag. 167
Of water that it may be the Medium of Sounds. Exp. I	ibid.
Of the Flight of the Spirits upon odious objects. Exp. I	ibid.
Of the super-Reflexion of Echo's. Exp. I	ibid.
Of the force of imagination imitating that of the Sense. Exp. I	pag. 168
Of Preservation of Bodies, Exp. I	ibid.
Of the Growth or Multiplying of Metalls. Exp. I	ibid.
Of the drawing the more base Metall in the more pretious. Exp. I	ibid.
Of Fixation of Bodies. Exp. I	pag. 169
Of the restless Nature of things in themselves, and their desire to change. Exp. I	ibid.

Century IX.

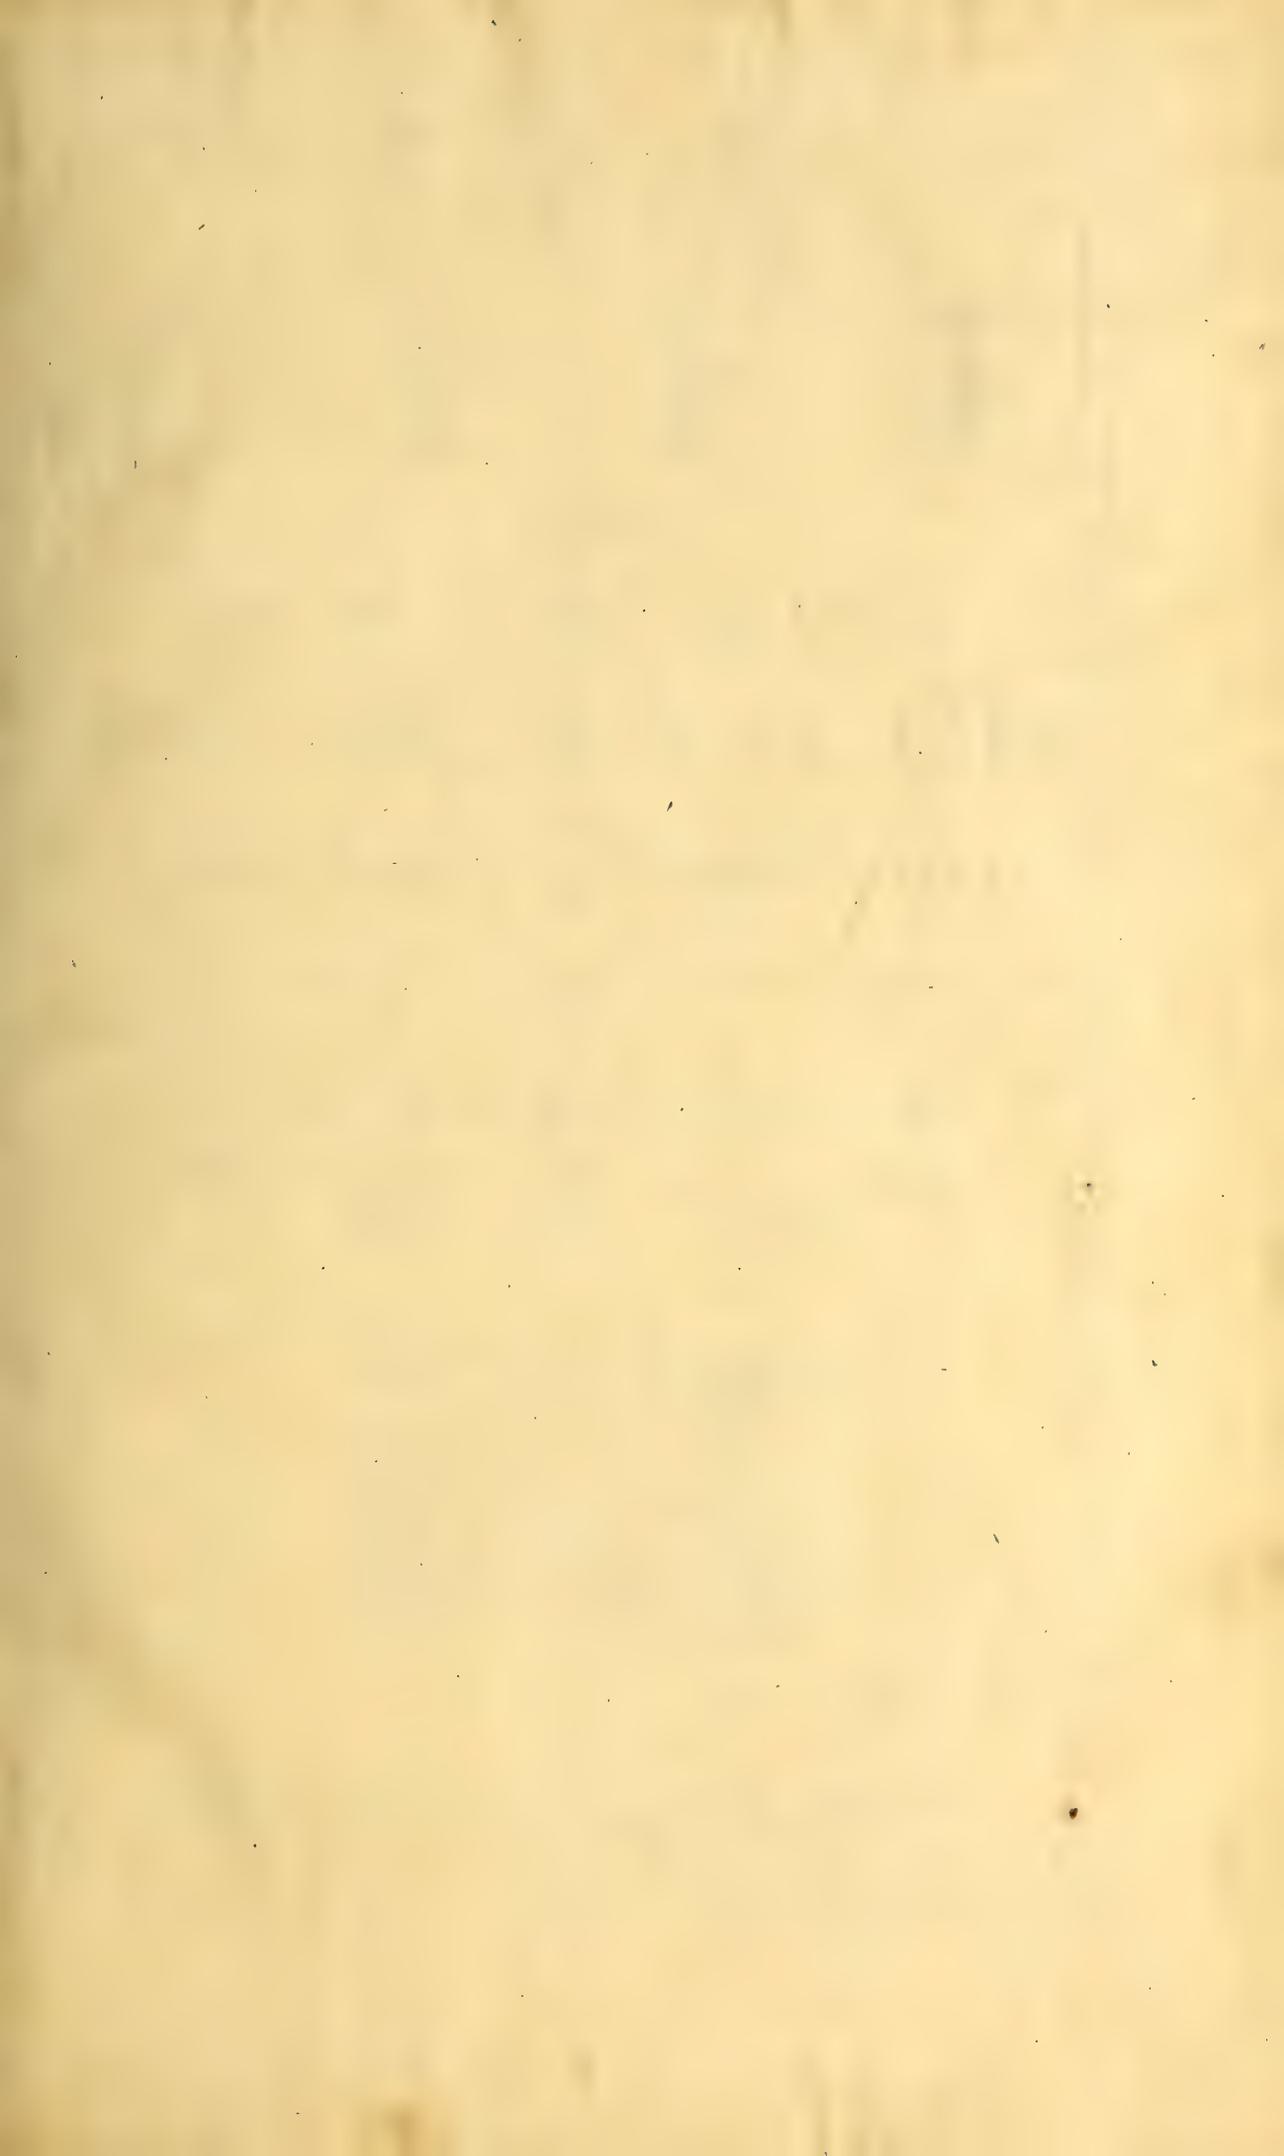

OF Perception in Bodies insensible, tending to natural Divination and subtle trials. Exp. 30	pag. 171
Of the Causes of Appetite in the Stomach. Exp. I	pag. 176
Of sweetness of Odour from the Rainbow. Exp. I	ibid.
Of sweet Smells. Exp. I	pag. 177
Of the Corporeal substance of Smells. Exp. I	ibid.
Of Fetide and Fragrant Odours. Exp. I	ibid.
Of the Causes of Putrefaction. Exp. I	pag. 178
Of Bodies imperfectly mixt. Exp. I	pag. 179
Of Concoction and Crudity. Exp. I	ibid.
Of Alterations which may be called Major. Exp. I	ibid.
Of Bodies Liquefiable, and not Liquefiable. Exp. I	pag. 180
Of Bodies Fragile and Tough. Exp. I	ibid.
Of the two kinds of Pneumaticalls in Bodies. Exp. I	pag. 181
Of Concretion and dissolution of Bodies. Exp. I	ibid.
Of Bodies hard and soft. Exp. I	ibid.
Of Bodies ductile and tensile. Exp. I	ibid.
Of several passions of Matter, and characters of Bodies. Exp. I	pag. 182
Of Inauration by sympathy. Exp. I	ibid.
Of Honey and Sugar. Exp. I	pag. 183
Of the finer sort of base Metalls. Exp. I	ibid.
Of certain Cement and Quarries. Exp. I	ibid.
Of the Altering of colours in Hairs and Feathers. Exp. I	ibid.
Of the difference of Living Creatures, Male and Female. Exp. I	pag. 184
Of the Comparative Magnitude of Living Creatures. Exp. I	ibid.
Of Producing Fruit without Coar or Stone. Exp. I	ibid.
Of the Melioration of Tobacco. Exp. I	pag. 185
Of several Heats working the same Effects. Exp. I	ibid.
Of Swelling and Dilatation in Boiling. Exp. I	ibid.
Of the Dulcoration of Fruits. Exp. I	pag. 186
Of Flesh Edible, and not Edible. Exp. I	ibid.
Of the Salamander. Exp. I	ibid.
Of the contrary operations of Time, upon Fruits and Liquors. Exp. I	pag. 187
Of blows and bruises. Exp. I	ibid.
Of the O-ris Root. Exp. I	ibid.

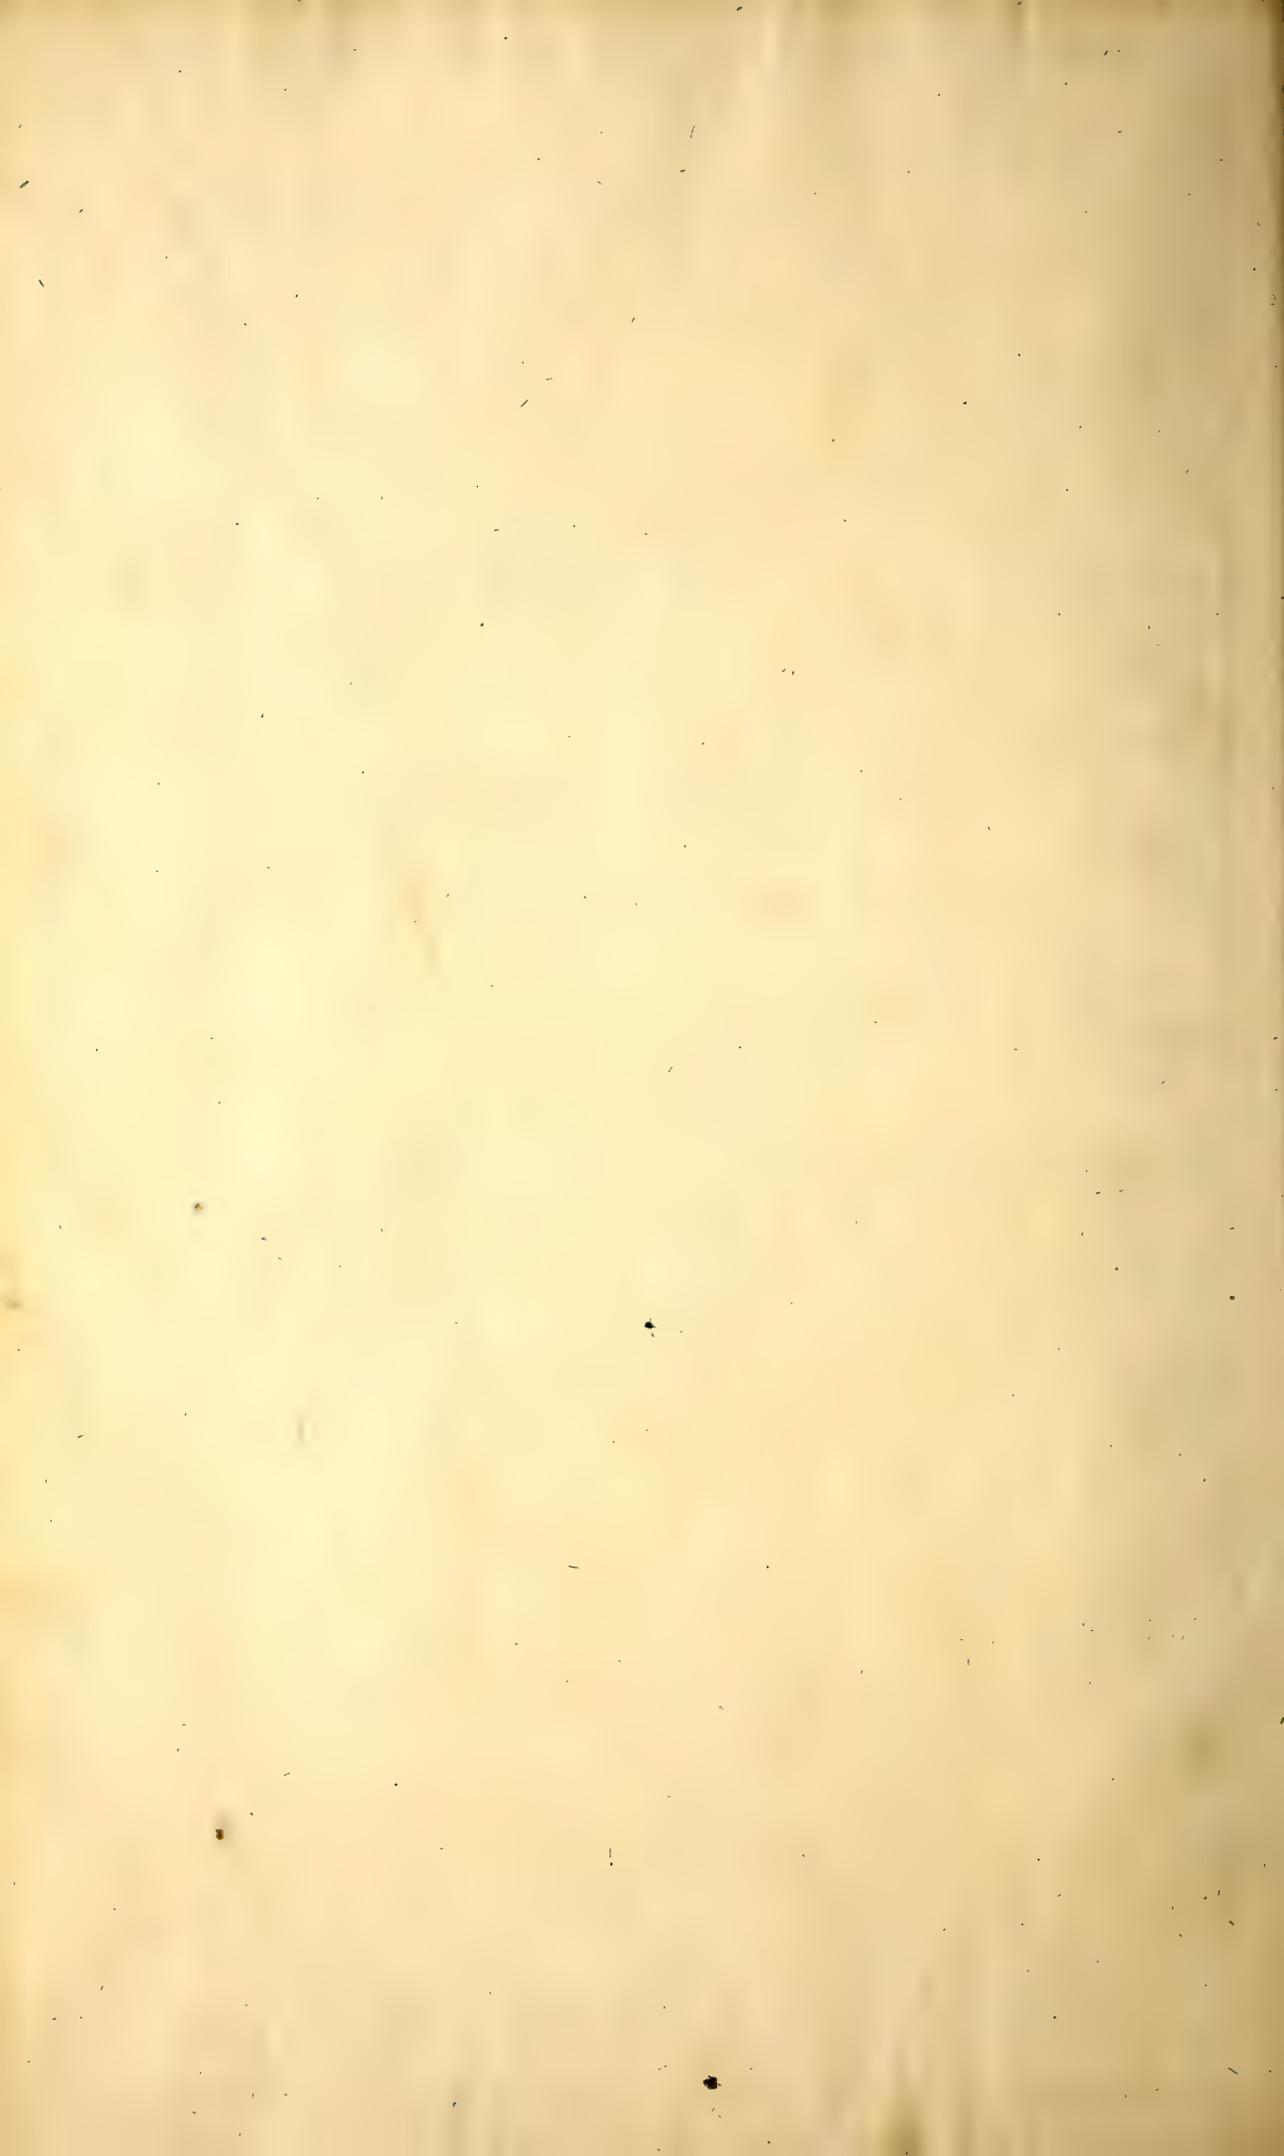

The TABLE.

Of the compression of Liquors. Exp. 1	ibid.
Of the working of water upon Air contiguous. Exp. 1	ibid.
Of the Nature of Air. Exp. 1	pag. 188
Of the Eyes and Sight. Exp. 7	ibid.
Of the colour of the sea, or other water. Exp. 1	pag. 189
Of shell-Fish. Exp. 1	ibid.
Of the Right side and the Left. Exp. 1	pag. 190
Of Frictions. Exp. 1	ibid.
Of Globes appearing flat at distance. Exp. 1	ibid.
Of Shadows. Exp. 1	ibid.
Of the Rowling and breaking of the seas. Exp. 1	ibid.
Of the Dulcoration of Salt-water. Exp. 1	ibid.
Of the return of saltness in pits by the Sea-shores. Exp. 1	pag. 191
Of Attraction by similitude of substance. Exp. 1	ibid.
Of Attraction. Exp. 1	ibid.
Of Heat under earth. Exp. 1	ibid.
Of Flying in the Air. Exp. 1	ibid.
Of the Scarlet Dy. Exp. 1	ibid.
Of Malificating. Exp. 1	pag. 192
Of the Rise of Liquors or Pouders, by means of flame. Exp. 1	ibid.
Of the influences of the Moon. Exp. 1	ibid.
Of Vinegar. Exp. 1	pag. 194
Of Creatures that sleep all Winter. Exp. 1	ibid.
Of the Generating of Creatures by Copulation, and by Putrefaction. Exp. 1	ibid.

Century X.

O f the Transmission and Influx of Immaterial Vertues and the Force of Imaginations whereof there be Experiments Monitory, three in all. Exp. 11	pag. 197
Of Emission of Spirits in Vapour, or Exhalation, odour like. Exp. 26	pag. 201
Of Emission of spiritual Species which felt the senses. Exp. 1	pag. 204
Of Emission of Immaterial Vertues, from the Minds, and the Spirits of Men, by Affections, Imagination, or other Impressions. Exp. 21	ibid.
Of the secret vertue of Sympathy, and Antipathy. Exp. 39	pag. 208
Of secret Vertues and Properties. Exp. 1	pag. 214
Of the General Sympathy of mens Spirits. Exp. 1	pag. 215

L I F E

OF THE

RIGHT HONOURABLE

FRANCIS BACON

Baron of *Verulam*, Viscount *St. Alban*.

FRANCIS BACON *the Glory, of his*
 Age and Nation; *The Adorner, and Orna-*
 ment of Learning; *Was born in York-houſe*
 or *York-Place, in the Strand, On the 22th,*
 Day of January; *in the Year of our Lord, 1560.*
His Father was that famous Councillor to Queen Elizabeth;
The ſecond Prop of the Kingdom in his Time, Sir Nicholas
Bacon, Knight, Lord Keeper of the Great Seal of Eng-
land; a Lord of known Prudence, Sufficiency, Moderation,
and Integrity. His Mother was Ann, one of the Daugh-
ters of Sir Anthony Cook; unto whom the Erudition, of
King Edward the Sixth; had been committed: A choyce
Lady, and Eminent for Piety, Vertue, and Learning; Being
exquiſitely ſkilled, for a Woman, in the Greek, and Latine,
Tongues. Theſe being the Parents, you may eaſily imagine,

The Life of the Right Honorable

what the Issue, was like to be; Having had whatsoever Nature or Breeding could put into him.

His first and childish years were not without some Mark of Eminency; At which time he was indued with that Pregnancy, and Towardliness, of wit; As they were Presages, of that Deep, and Universal Apprehension, which was manifest in him, afterward: And caused him to be taken notice of, by several Persons, of Worth and Place; And especially, by the Queen; who (as I have been informed) delighted much, then, to confer with him; And to prove him with Questions; unto whom, he delivered Himself, with that Gravity, and Maturity, above his years; That Her Majesty would often term him, The young Lord Keeper. Being asked by the Queen, how old he was? He answered with much discretion, being then but a Boy; That he was two years younger than her Majesties happy Reign; with which answer the Queen was much taken.

At the ordinary years, of Ripeness, for the University; or rather, something earlier; he was sent by his Father, to Trinity Colledge, in Cambridge; To be educated, and bred under the Tuition of Doctor John White-Gift, then Master of the Colledge; Afterwards the renowned Arch-Bishop of Canterbury; a Prelate of the first Magnitude of Sanctity, Learning, Patience, and Humility; Under whom, He was observed, to have been more, than an Ordinary Proficient, in the severall Arts and Sciences. Whilst he was commorant, in the Vniversity, about 16 years of age, (as his Lordship hath been pleased to impart unto my self;) he first fell into the Dislike, of the Philosophy of Aristotle; Not for the Worthlessness of the Author, to whom he would ever ascribe all High Attributes; But for the Vnfruitfulness, of the way; Being a Philosophy, (as his Lordship used to say) only strong, for Disputations, and Contentions; But Barren, of the production of Works, for the Benefit of the Life of Man. In which Mind he continued to his Dying Day.

After he had passed, the Circle of the Liberal Arts; His Father thought fit, to frame, and mould him for the Arts of State; and, for that end, sent him over into France, with

Sir

Sir Amyas Paulet, then Employed Ambassadour Lieger, into France; By whom, he was, after awhile, held fit to be entrusted, with some Message, or Advertisement, to the Queen; which having performed with great Approbation, he returned back into France again; with intention to continue, for some years, there. In his absence, in France, his Father, the Lord Keeper, died; Having collected, (as I have heard, of Knowing Persons) a considerable sum of Money, which he had separated, with Intention, to have made a competent Purchase of Land, for the Lively-hood of this his youngest Son; (who was onely unprovided for; and though he was the youngest in years, yet he was not the lowest, in his Fathers affection;) But the said Purchase, being unaccomplished, at his Fathers Death, there came no greater share to him, than his single Part, and Portion, of the Money, dividable amongst five Brethren; By which means, he lived, in some streits, and Necessities, in his younger years. For as for that pleasant Scite, and Mannor of Gorhambury, he came not to it, till many years after, by the Death, of his Dearest Brother, Mr. Anthony Bacon; a Gentleman, equal to him, in Height of Wit; Though inferiour to him, in the Endowments of Learning and Knowledge; Unto whom he was, most nearly conjoyned in affection; They two being the sole Male-issue of a second Venter.

*Being returned from Travail, he applied himself, to the Study of the Common-Law; which he took upon him to be his Profession. In which, he obtained to great Excellency. Though he made that, (as himself said) but as an accessory, and not as his Principal study. He wrote several Tractates, upon that Subject. Wherein, though some great Masters, of the Law did out-go him in Bulk, and Particularities of Cases; yet, in the Science, of the Grounds, and Mysteries, of the Law, he was exceeded by none. In this way, he was after a while, sworn, of the Queens Counsel Learned, Extraordinary; a grace, (if I erre not) scarce known before. He seated himself for the commodity of his studies, and Practise; amongst the Honourable Society, of Greyes-Inn; Of which Houle; he was a Member; where he Erected,
that*

that Elegant Pile, or Structure, commonly known by the Name of the Lord Bacons Lodgings; which he Inhabited by Turns, the most part of his Life, (some few years onely excepted,) unto his Dying Day. In which House he carried himself, with such Sweetness, Comity, and Generosity; That he was much revered, and beloved, by the Readers and Gentlemen of the House.

Notwithstanding, that he professed the Law for his Livelihood, and Subsistence; yet his Heart and Affection was more carried after the Affairs and Places of Estate; for which, if the Majesty Royal then, had been pleased, he was most fit. In his younger years, he studied the Service, and Fortunes, (as they call them,) of that Noble, but unfortunate Earl, the Earl of Essex; unto whom he was, in a sort, a Private and free Counsellor, and gave him Safe and Honourable Advice, till, in the end, the Earl inclined too much, to the violent and precipitate Counsell of others, his Adherents, and Followers; which was his Fate and Ruine.

His Birth and other Capacities qualified him, above others of his Profession, to have ordinary accesses at Court; and to come frequently into the Queens Eye; who would often grace him with private and free Communication; Not onely about Matters of his Profession, or Business in Law; But also, about the arduous Affairs of Estate; From whom she received, from time to time, great Satisfaction. Nevertheless though she cheered him much, with the Bounty of her Countenance; yet she never cheered him with the Bounty of her Hand: Having never conferred upon him, any Ordinary Place or Means of Honour or Profit, Save onely one dry Reversion of the Registers Office, in the Star-Chamber; worth about 1600 l. per Annum; For which he waited in Expectation, either fully or near twenty years; Of which his Lordship would say, in Queen Elizabeths Time; That it was like another mans Ground, buttalling upon his House; which might mend his Prospect, but it did not fill his Barn. (Nevertheless in the time of King James, it fell unto him, which might be imputed; not so much to her Majesties averfeness and Disaffection, towards him;

as the Arts and Policy of a Great Statesman, then; who laboured by all industrious, and secret Means, to suppress, and keep him down; lest, if he had risen, he might have obscured his Glory:

But though, he stood long at a stay, in the Days of his Mistress Queen Elizabeth; Yet, after the change, and Coming in of his New Master, King James, he made a great progress; by whom he was much comforted, in Places of Trust, Honour, and Revenue, I have seen, a Letter of his Lordships, to King James, wherein he makes Acknowledgement; That he was that Master to him, that had raised and advanced him nine times; Thrice in Dignity, and Six times in Office, His Offices (as I conceive) were Counsel learned extraordinary, to his Majesty, as he had been, to Queen Elizabeth; Kings Solliciter General; His Majesties Attorney General; Counsellor of Estate, being yet but Attorney; Lord Keeper of the Great Seal of England; Lastly, Lord Chancellor: which two last Places, though they be the same, in Authority and Power; yet they differ in Patent, Height, and Favour of the Prince. Since whose time, none of his Successors, until this present Honourable Lord, did ever bear the Title of Lord Chancellor. His Dignities were first Knight, then Baron of Verulam; Lastly, Viscount Saint Alban: Besides other good Gifts and Bounties of the Hand, which his Majesty gave him, Both out of the Broad-Seal, and out of the Alienation-Office, To the value, in both of eighteen hundred pounds per annum: which with his Mannour of Gorhambury; and other Lands and Possessions, near thereunto adjoining, amounting to a third part more, he retained to his Dying Day.

Towards his Rising years, not before, he entered into a married Estate, and took to Wife, Alice, one of the Daughters, and Co-heirs of Benedict Barnham, Esquire, and Alderman of London, with whom he received, a sufficiently ample, and liberal Portion, in Marriage. Children he had none: which, though they be the means to perpetuate our Names, after our Deaths; yet he had other Issues to perpetuate his Name; The Issues of his Brain; in which he was e-

ver happy, and admired; as Jupiter was, in the production of Pallas. Neither did the want of Children, detract from his good usage of his Consort, during the Intermarriage; whom he prosecuted, with much Conjugal Love, and Respect; with many Rich Gifts, and Endowments; Besides a Robe of Honour, which he invested her withal; which she wore untill her Dying Day; being twenty years and more, after his Death.

The last five years of his Life, being with drawn from Civil affaires, and from an Active Life, he employed wholly in Contemplation and Studies. A thing, whereof his Lordship would often speak, during his Active Life; as if he affected to dy in the Shadow, and not in the Light; which also may be found in severall Passages of his Works. In which time he composed, the greatest part of his Books, and Writings; Both in English and Latine; Which I will enumerate, (as near as I can) in the just order, wherein they were written. The History of the Reign of King Henry the Seventh; Abcedarium Naturæ; or a Metaphysical piece; which is lost; Historia Ventorum; Historia Vitæ & Mortis; Historia Densæ & Raris, not yet printed; Historia Gravis & Levis, which is also lost; A Discourse of a War with Spain; A Dialogue, touching an Holy War. The Fable of the New Atlantis. A Preface to a Digest of the Lawes of England. The Beginning, of the History of the Reign of King Henry the Eighth. De Augmentis Scientiarum, Or the Advancement of Learning, put into Latin, with severall Enrichments and Enlargements. Counsels Civil, and Moral. Or his Book of Essayes, likewise Enriched and Enlarged. The Conversion of certain Psalms, into English Verse. The Translation into Latin; of the History of King Henry the Seventh. Of the Counsels Civil and Moral. Of the Dialogue of the Holy War. Of the Fable of the New Atlantis, For the Benefit of other Nations. His Revising of his Book, De Sapientia Veterum. Inquisitio de Magnete, Topica Inquisitionis, de Luce & Lumine; Both these not yet Printed, Lastly, Sylva sylvarum, or the Natural History. These were the Fruits,

Fruits and Productions, of his last five years. His Lordship also designed upon the Motion and Invitation of his late Majesty; To have written the Reign of King Henry the Eighth; But that Work Perished in the Designation merely; God not lending him Life, to proceed further upon it, then only in one Mornings Work: whereof there is Extant, An, Ex Ungue Leonem, already Printed, in his Lordships Miscellany Works.

There is a Commemoration due; As well, to his Abilities, and Vertues, as to the Course of his Life. Those Abilities, which commonly go single in other Men, though of prime, and Observaeable, Parts, were all conjoynd, and met in Him. Those are, Sharpness of Wit, Memory, Judgment, and Elocution. For the Former Three, his Books do abundantly speak them; which, with what Sufficiency he wrote, let the World judge; But with what Celerity he wrote them, I can best testifie. But for the Fourth, his Elocution; I will only set down, what I heard, Sir Walter Rawleigh, once speak of him, by way of Comparison; (whose Judgment may well be trusted;) That the Earl of Salisbury, was an excellent Speaker, but no good Pen-man; That the Earl of Northampton, (the Lord Henry Howard,) was an excellent Pen-man, but no good speaker; But that Sir Francis Bacon, was Eminent in both.

I have been enduced to think; That if there were, a Beam of Knowledge derived from God upon any Man, in these Modern Times, it was upon Him. For though he was a great Reader of Books; yet he had not his Knowledge from Books; But from some Grounds, and Notions from within Himself. Which notwithstanding, he vented with great Caution and Circumspection. His Book, of Instauration Magna, (which, in his own Account, was the chiefest of his Works,) was no Slight Imagination, or Fancy, of his brain; but a settled, and Concocted Notion; The Production of many years, Labour, and Travel. I my Self, have seen, at the least, Twelve Coppies, of the Instauration; Revised, year by year, one after another; And every year altered, and amended,

in the Frame thereof; Till, at last, it came to that Model, in which it was committed to the Press; As many Living Creatures, do lick their young ones, till they bring them, to their strength of Limbs.

In the Composing of his Books, he did rather drive at a Masculine and clear Expression, than at any Fineness, or Affectation of Phrases, and would often ask, if the Meaning were expressed plainly enough: as being one that accounted words to be but subservent, or Ministerial, to Matter; and not the principal. And if his Stile were Polite, it was because he could do no otherwise. Neither was he given, to any Light Conceits; Or Descanting upon Words; But did ever, purposely, and industriously, avoid them; For he held such Things, to be but Digressions, or Diversions, from the Scope intended; and to derogate, from the Weight and Dignity of the Stile.

He was no Plodder upon Books; Though he read much, and that with great Judgement and Rejection of Impertinences, incident to many Authors; For he would ever interlace a Moderate Relaxation of His Minde with his Studies; As Walking, Or Taking the Air abroad in his Coach; or some other befitting Recreation; and yet, he would loose no Time, In as much, as upon his First, and Immediate Return, he would fall to Reading again, and so suffer no Moment of Time to slip from him without some present Improvement.

*His Meales were Refections of the Eare as well as of the Stomack. Like the Noctes Atticæ; or Convivia Deipno-Sophistarum; Wherein a Man might be refreshed in his Mind and understanding, no less then in his Body. And I have known some, of no mean Parts, that have professed to make use of their Note-Books, when they have risen from his Table. In which Conversations, and otherwise, he was no Dashing Man, as some men are; But ever a Countenancer, and Fosterer, of another Mans Parts. Neither was he one, that would appropriate the Speech, wholly to Himself; or delight to out-vie others; But leave a Liberty, to the Co-Assessours, to take their Turns. Wherein he would draw
a Man*

a Man on, and allure him, to speak upon such a subject, as wherein he was peculiarly Skilful, and would delight to speak. And, for Himself, he contemned no Mans Observations, but would light his Torch at every mans Candle.

His Opinions and Assertions were, for the most part, Binding, and not contradicted by any; Rather like Oracles, than Discourses. Which may be imputed, either to the well weighing of his Sentence, by the Skales of Truth, and Reason; Or else to the Reverence and Estimation, wherein he was commonly had, that no Man would contest with him: So that there was no Argumentation, or Pro and Con (as they term it) at his Table: Or if there chanced to be any it was carried with much Submission and Moderation.

I have often observed, and so have other Men of great account, That if he had occasion to repeat another Mans Words after him, he had an use and faculty to dress them in better Vestments, and Apparel than they had before: So that the Authour should find his own speech much amended; and yet the substance of it still retained: As if it had been Natural to him to use good Forms; As Ovid spake of his Faculty of Versifying.

Et quod tentabam scribere, Versus erat,

When his Office called him, as he was of the Kings Counsel Learned, to charge any Offenders, either in Criminals, or Capitals; He was never of an Insulting, or Domineering Nature over them; But alwayes tender Hearted, and carrying himself decently towards the Parties; (Though it was his Duty, to charge them home:) But yet, as one, that looked upon the Example, with the Eye of Severity, But upon the Person, with the Eye of Pitty, and Compassion. And in Civil Business, as he was Counsellor of Estate, he had the best way of advising; Not engaging his Master, in any Precipitate or grievous Courses; but in Moderate and Fair Proceedings: The King, whom he served, giving him this Testimony; That he ever dealt, in Businesse, *Suavibus*

Modis; Which was the way that was most according to his own heart.

Neither was He in his time lesse gracious with the Subject than with his Sovereign. He was ever acceptable to the House of Commons, when he was a Member thereof. Being the Kings Attorney, and chosen to a place in Parliament; he was allowed and dispensed with to sit in the House; which was not permitted to other Attorneys.

And as he was a good Servant to his Master; Being never, in nineteen years service (as he himself averred,) rebuked by the King for any Thing relating to his Majesty; So he was a good Master to his Servants, And rewarded their long attendance with good Places, freely when they fell into his Power. Which was the Cause that so many young Gentlemen of Blood and Quality, sought to list themselves in his Retinue. And if he were abused by any of them in their Places; It was onely the Errour, of the Goodness, of his Nature; but the Badges of their Indiscretions, and Intemperances.

This Lord was Religious; For though the World be apt to suspect, and prejudice, Great Wits, and Politicks to have somewhat of the Atheist; Yet he was conversant with God: as appeareth, by several Passages, throughout the whole Current of his Writings. Otherwise he should have crossed his own Principles; which were, That a little Philosophy, maketh Men apt to forget God; As attributing too much to second Causes; But Depth of Philosophy, bringeth Men back to God again. Now I am sure there is no Man that will deny him, or account otherwise of him, but to have him been a deep Philosopher. And not only so, But he was able to render a Reason of the Hope which was in him; Which that Writing of his, of the Confession of the Faith, doth abundantly testify. He repaired frequently, when his Health would permit him, to the Service of the Church, To bear Sermons, To the Administration of the Sacrament of the Blessed Body and Bloud of Christ; and died in the true Faith established in the Church of England.

This

This is most true; He was free from Malice; which, (as he said Himself,) He never bred nor fed. He was no Reven-ger of Injuries; which, if he had minded, he had both Oppor-tunity and Place High enough, to have done it. He was no Heaver of Men out of their Places, as delighting in their Ruine and Undoing. He was no defamer of any Man to his Prince. One Day, when a great States-Man was new-ly Dead, That had not been his Friend; The King asked him, What he thought of that Lord, which was gone? He an-swered, That he would never have made his Majesties Estate better; But he was sure he would have kept it from being worse. Which was the worst, he would say of him. Which I reckon, not among his Moral, but his Christian Vertues.

His Fame is greater, and sounds louder in Forraign Parts abroad, than at home in his own Nation. Thereby verify-ing that Divine Sentence, A Prophet is not without ho-nour, save in his own Country, and in his own house. Concerning which I will give you a Taste onely, out of a Let-ter, written from Italy (The Store-house of Refined Wits) to the late Earl of Devonshire, Then, the Lord Candish. I will expect the New Essayes of my Lord Chancellor Bacon, as also his History, with a great deal of De-sire, and whatsoever else he shall compose. But in Particular of his History, I promise my self a thing per-fect and Singular; especially in Henry the Seventh; Where he may exercise the Talent of his Divine Understand-ing. This Lord is more and more known, and his Books here, more and more delighted in; And those Men that have more than ordinary Knowledge in Humane affairs, esteem him one of the most capable Spirits of this Age; and he is truly such. Now his Fame doth not decree with Dayes since, but rather increase. Di-vers of his Works have been anciently, and yet lately, tran-slated into other Tongues, both Learned and Modern, by Forraign Pens. Several Persons of Quality, during his Lordships Life, crossed the Seas on purpose to gain an Oppor-tunity of seeing him, and Discoursing with him: whereof one,

carried his Lordships Picture, from Head to Foot, over with him into France; as a Thing which, he foresaw, would be much desired there; That so they might enjoy, the Image of his Person; as well as the Images of his Brain, his Books. Amongst the rest, Marquis Fiat; a French-Nobleman; who came Ambassador into England, in the beginning of Queen Mary, Wife to King Charles, was taken with an extraordinary Desire of Seeing him: For which, he made way by a Friend: And when he came to him, being then, through weakness, confined to his Bed; The Marquis saluted him with this High-Expression; That his Lordship, had been ever to Him, like the Angels; of whom he had often heard, and read much of them in Books; But he never saw them. After which they contracted an intimate Acquaintance; And the Marquis did so much revere him; that besides his Frequent visits; they wrote Letters, one to the other, under the Titles and Appellations, of Father and Son; As for his many Salutations, by Letters from Forraign Worthies, devoted to Learning; I forbear to mention them; Because that is a Thing common to other Men of Learning, or Note together with him.

But yet, in this Matter of his Fame, I speak, in the Comparative, onely, and not in the Exclusive. For his Reputation is great, in his own Nation, also; Especially amongst those, that are of a more acute, and sharper Judgement: Which I will exemplifie, but with two Testimonies, and no more. The Former; When his History of King Henry the Seventh was to come forth; It was delivered to the old Lord Brook, to be perused by him; who, when he had dispatched it, returned it to the Author, with this Eulogy: Commend me to my Lord; and bid him take care, to get good Paper and Inke, for the Work is incomparable. The other shall be that, of Doctor Samuel Collins, late Provost, of Kings Colledge, in Cambridge, A Man of no vulgar Wit, who affirmed unto me, That when he had read, the Book of the Advancement of Learning, He found himself in a case to begin his Studies a new, and that he had lost all the Time of his studying before.

It hath been desired; That something should be signified, touching his Diet; And the Regiment of his Health: Of which, in regard, of his Universal Insight into Nature, he may (perhaps,) be to some, an Example. For his Diet; It was rather a plentiful, and liberal, Diet, as his Stomack would bear it, then a Restrained; Which he also commended in his Book of the History of Life and Death. In his younger years, he was much given to the Finer and Lighter sort of Meats, as of Fowles; and such like: But afterward, when he grew more judicious; He preferred the stronger Meats; such as the Shambles afforded; As those Meats, which bred the more firm and substantial Juices of the Body, and less Diffipable; upon which, he would often make his Meal; Though he had other Meats, upon the Table. You may be sure; He would not neglect that Himself, which He so much extolled in his Writings; And that was the Use of Niter: Whereof he took in the Quantity of about three Grains, in thin warm Broath, every Morning, for thirty years together, next before his Death. And for Physick, he did, indeed, live Physically, but not miserably; For he took only a Maceration of Rhubarb; Infused into a Draught of White Wine, and Beer, mingled together, for the Space of half an Hour; Once in six or seven Dayes; Immediately before his Meal, (whether Dinner, or Supper,) that it might dry, the Body, lesse; which (as he said,) did carry away frequently, the Grosser Humours of the Body, and not diminish, or carry away, any of the Spirits, as Sweating doth. And this was no Grievous Thing to take. As for other Physick, in an ordinary way, (whatsoever hath been vulgarly spoken;) he took not. His Receipt, for the Gout; which did, constantly, ease him of his Pain, within two Hours, Is already set down in the End, of the Natural History.

It may seem, the Moon, had some Principal Place, in the Figure of his Nativity. For the Moon, was never in her Palsion or Eclipsed, but he was surprized, with a sudden Fit, of Fainting: And that, though he observed not, nor took any previous Knowledge, of the Eclipse thereof; and as soon as the Eclipse ceased, he was restored, to his former strength again.

He

He died, on the 9th Day of April, in the year 1626; In the early Morning, of the Day then celebrated for our Saviours Resurrection, In the 66th year of his Age; at the Earle of Arundells House in High-gate, near London; To which Place, he casually repaired, about a week before, God so ordaining, that he should dye there; Of a Gentle Fever, accidentally accompanied, with a great Cold; whereby the Defluxion of Rheume, fell so plentifully upon his Breast, that he died by Suffocation: And was buried, in Saint Michaels Church, at Saint Albans; Being the Place, designed for his Burial, by his last Will, and Testament; Both because the Body of his Mother was interred there; And because, it was the only Church, then remaining, within the Precincts of old Verulam: Where he hath a Monument, erected for him of White Marble; (By the Care, and Gratitude, of Sir Thomas Meautys, Knight, formerly his Lordships Secretary; Afterwards Clark of the Kings Honourable Privy Counsell, under two Kings:) Representing his full Pourtraiture in the Posture of studying; with an Inscription composed by that Accomplisht Gentleman, and Rare Wit, Sir Henry Wotton.

But howsoever his Body was Mortal; yet no doubt his Memory and Works will live; And will in all probability, last as long as the World lasteth. In order to which, I have endeavoured, (after my poor Ability,) to do this Honour to his Lordship by way, of enducing to the same.

SPEECHES

NEW

ATLANTIS.

A VVork unfinished.

Written by the Right Honorable,

FRANCIS

Lord *Verulam*, Viscount *St. Albans*.

W. T. A. J. T. A.

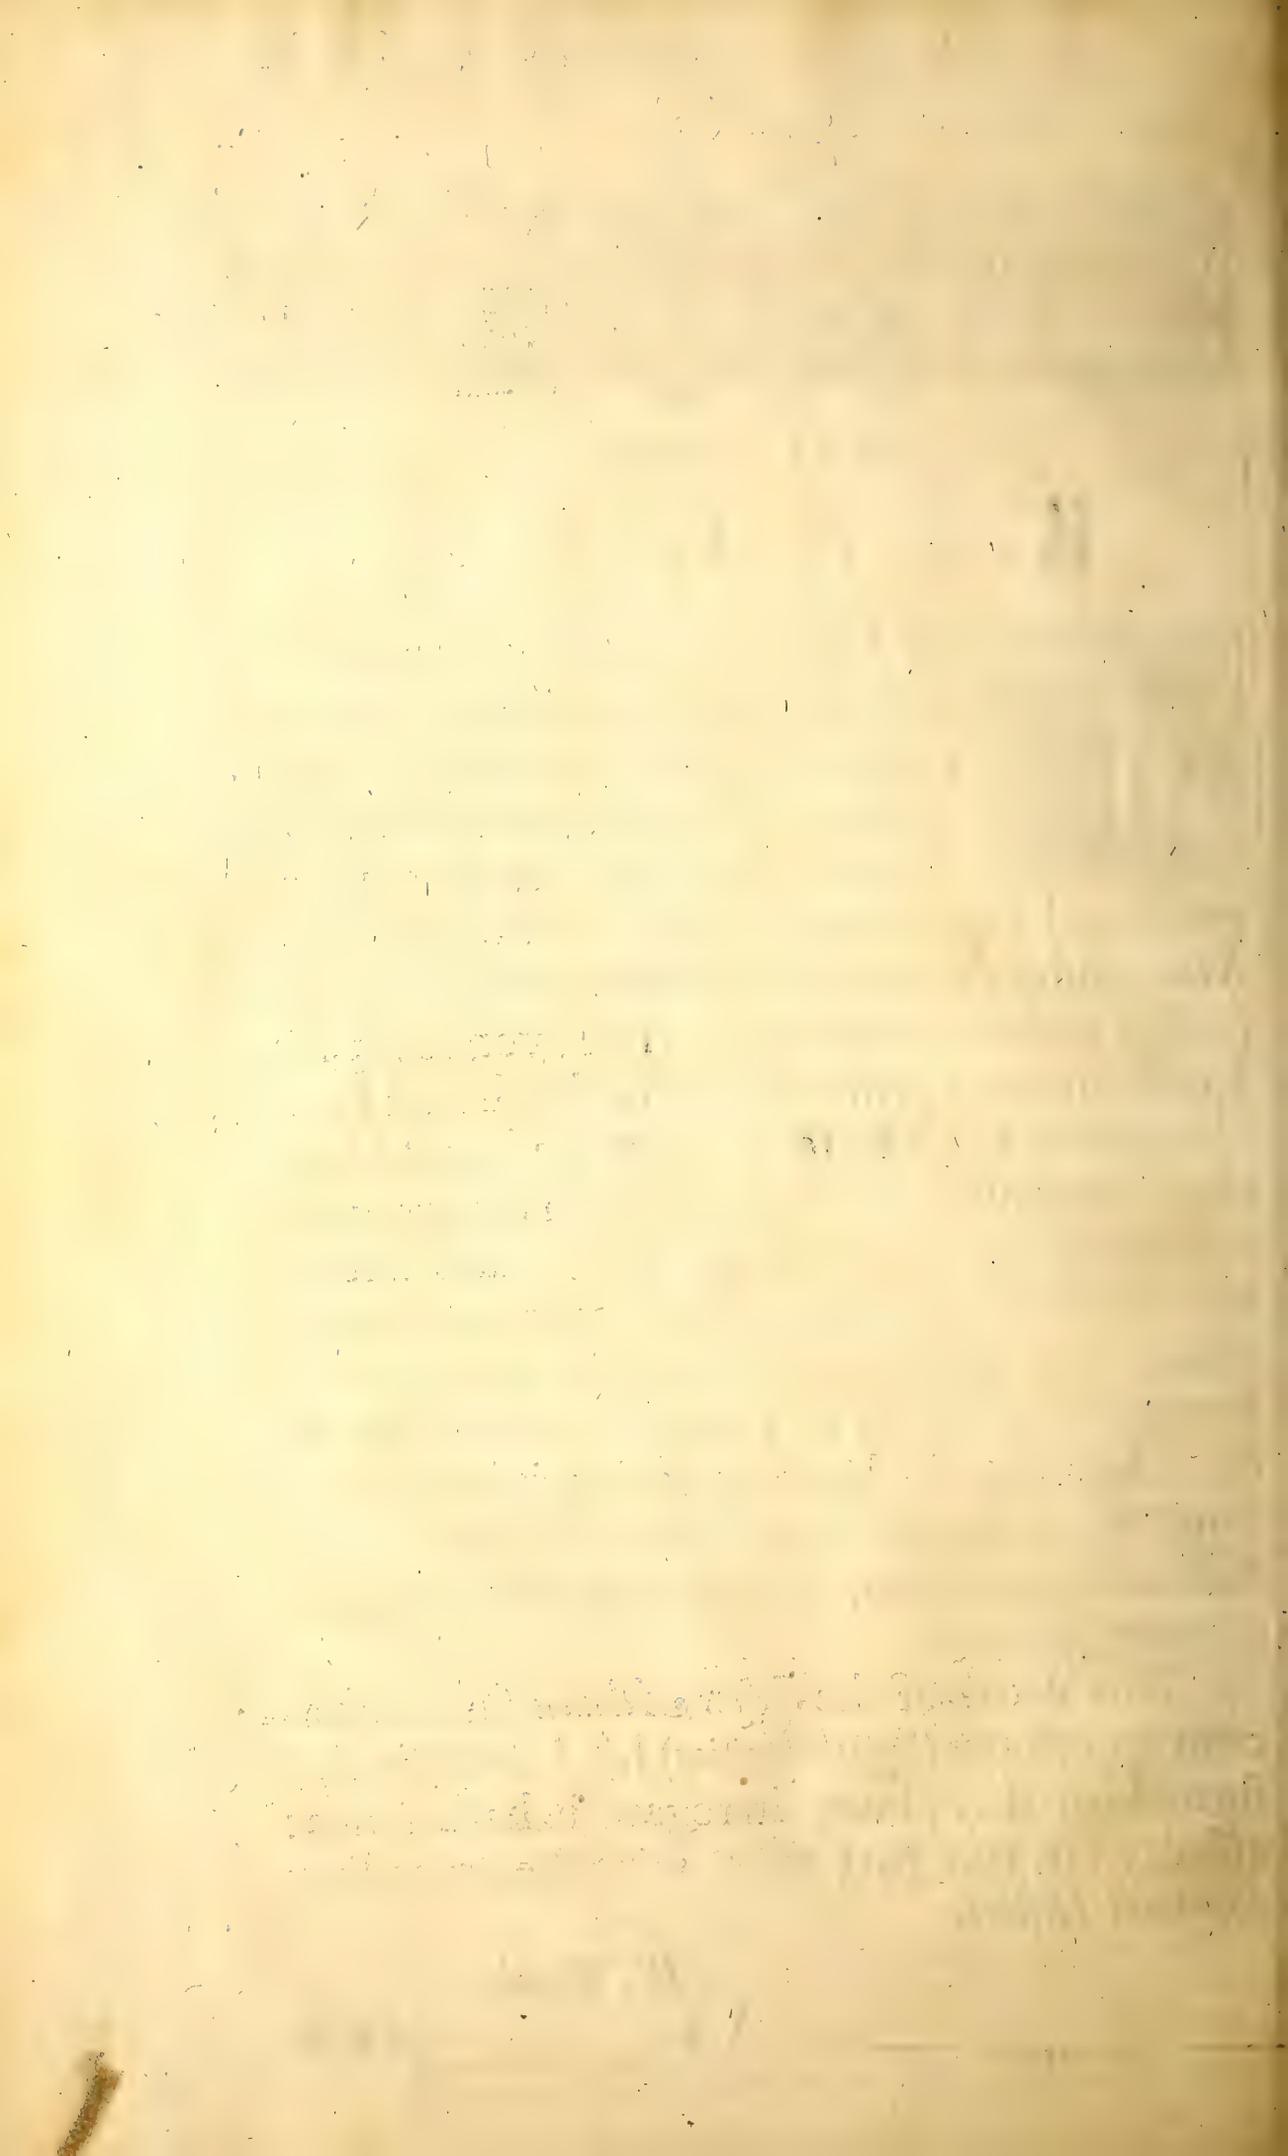

TO THE
R E A D E R.

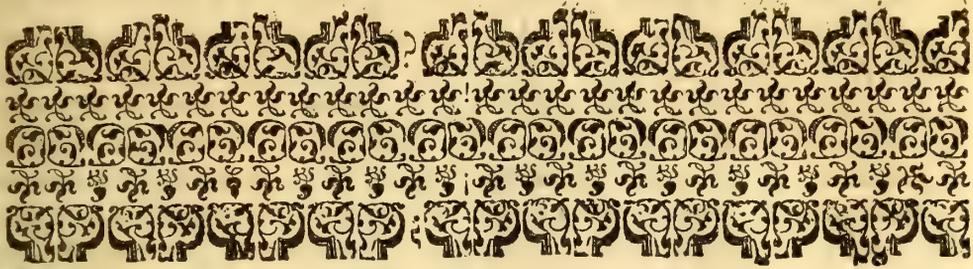

His *Fable* my Lord devised, to the end that he might exhibit therein a *Model* or *Description* of a *College*, instituted for the Interpreting of *Nature*, and the producing of great and marvellous *Works* for the benefit of *Men*, under the name of *Solomons House*, or, *The College of the Six days Works*. And even so far his Lordship hath proceeded as to finish that Part. Certainly, the *Model* is more vast and high, than can possibly be imitated in all things, notwithstanding most things therein are within Mens power to effect. His Lordship thought also in this present *Fable* to have composed a *Frame* of *Laws*, or of the best *State* or *Mould* of a *Commonwealth*; but fore-seeing it would be a long *Work*, his desire of *Collecting* the *Natural History* diverted him, which he preferred many degrees before it.

This *Work* of the *New Atlantis* (as much as concerneth the *English Edition*) his Lordship designed for this place, in regard it hath so near affinity (in one part of it) with the preceding *Natural History*.

W. Rawley.

NEW ATLANTIS.

WE sailed from *Peru* (where we had continued by the space of one whole year) for *China* and *Japan* by the South Sea, taking with us Victuals for Twelve Moneths, and had good Winds from the East; though soft and weak, for Five Moneths space and more; but then the Wind came about, and settled in the West for many days; so as we could make little or no way, and were sometimes in purpose to turn back: But then again, there arose strong and great Winds from the South, with a Point East, which carried us up (for all that we could do) towards the North; by which time our Victuals failed us, though we had made good spare of them: So that finding our selves in the midst of the greatest Wilderness of Waters in the World, without Victual, we gave our selves for lost men, and prepared for death. Yet we did lift up our hearts and voices to God above, *Who sheweth his wonders in the deep*; beseeching him of his mercy, That as in the Beginning he discovered the Face of the deep, and brought forth dry-land; so he would now discover Land to us, that we might not perish. And it came to pass, that the next day about Evening, we saw within a Kenning before us, towards the North, as it were thicker Clouds, which did put us in some hope of Land; knowing how that part of the South-Sea was utterly unknown, and might have Islands or Continents that hitherto were not come to light. Wherefore we bent our course thither, where we saw the appearance of Land all that night; and in the dawning of the next day, we might plainly discern that it was a Land flat to our sight, and full of Boscage, which made it shew the more dark; and after an hour and a halfe sailing, we entred into a good Haven, being the Port of a fair City, not great indeed, but well built, and that gave a pleasant view from the Sea: And we thinking every minute long, till we were on Land, came close to the Shore and offered to land; but straight-ways we saw divers of the people with Bastons in their hands, (as it were) forbidding us to land, yet without any cries or fierceness, but onely as warning us off by signs that they made. Whereupon being not a little discomforted, we were advising with our selves, what we should do. During which time, there made forth to us a small Boat with about eight persons in it, whereof one of them had in his hand a Tip-staff of a Yellow Cane, tipped at both ends with Blew, who made aboard our Ship without any shew of distrust at all: And when he saw one of our number present himself somewhat afore the rest, he drew forth a little Scroul of Parchment (somewhat yellower then our Parchment;

and shining like the Leaves of Writing-Tables, but otherwise soft and flexible) and delivered it to our foremost man. In which Scroul were written in ancient *Hebrew*, and in ancient *Greek*, and in good *Latine* of the School, and in *Spanish*, these words, "Land ye not, none of you, and provide to be gone from this Coast within sixteen days, except you have further time given you: Mean while, if you want Fresh-water or Victual, or help for your Sick, or that your Ship needeth repair, write down your wants, and you shall have that which belongeth to Mercy. This Scroul was signed with a stamp of *Cherubims Wings*, not spread, but hanging downwards, and by them a *Cross*. This being delivered, the Officer returned, and left onely a Servant with us to receive our answer. Consulting hereupon amongst our selves, we were much perplexed. The denial of Landing, and hasty warning us away, troubled us much. On the other side, to finde that the people had Languages, and were so full of Humanity, did comfort us not a little; and above all, the Sign of the *Cross* to that Instrument, was to us a great rejoycing, and, as it were, a certain presage of good. Our answer was in the *Spanish* Tongue, "That for our Ship it was well, for we had rather met with Calms and contrary Winds then any Tempests. For our Sick, they were many, and in very ill case; so that if they were not permitted to land, they ran in danger of their lives. Our other wants we set down in particular, adding, "That we had some little store of Merchandize, which if it pleased them to deal for, it might supply our wants without being chargeable unto them. We offered some reward in Pistolets unto the Servant, and a piece of Crimson Velvet to be presented to the Officer; but the Servant took them not, nor would scarce look upon them, and so left us, and went back in another little Boat which was sent for him.

About three hours after we had dispatched our Answer, there came towards us a person (as it seemed) of place: He had on him a Gown with wide Sleeves of a kinde of Water-Chamolet, of an excellent Azure colour, far more glossie then ours; his under apparel was green, and so was his Hat, being in the form of a Turbant, daintily made, and not so huge as the *Turkish* Turbants; and the Locks of his Hair came down below the brims of it: A Reverend Man was he to behold. He came in a Boat gilt in some part of it, with four persons more onely in that Boat, and was followed by another Boat wherein were some twenty. When he was come within a flight-shot of our Ship, signs were made to us, that we should send forth some to meet him upon the Water; which we presently did in our Ship-boat, sending the principal Man amongst us save one, and four of our number with him. When we were come within six yards of their Boat, they called to us to stay, and not to approach further; which we did: And thereupon the Man whom I before described stood up, and with a loud voice in *Spanish*, asked, *Are ye Christians?* We answered, *We were*, fearing the less, because of the *Cross* we had seen in the Subscription. At which answer, the said person lift up his right hand towards Heaven, and drevv it softly to his mouth, (vvhich is the gesture they use vvhhen they thank God) and then said, "If you vwill svwear (all of you) by the Merits of the Saviour that ye are no Pirates, nor have shed blood, lawfully nor unlawfully, vwithin forty days past, you may have License to come on Land. *We said*, "VVe were all ready to take that Oath. VWhereupon one of those that were vwith him, being (as it seemed) a *Noraisy*, made an Entry of this Act. VWhich done, another of the attendants of the Great Person, vvhich was vwith him

him in the same Boat, after his Lord had spoken a little to him, said aloud, "My Lord, would have you know, that it is not of Pride or Greatness that he cometh not aboard your Ship; but for that, in your Answer, you declare, That you have many sick amongst you, he was warned by the *Conservator of Health* of the City, that he should keep a distance. VVe bowed our selves towards him, and answered, "VVe were his humble Servants, and accounted for great Honor and singular Humanity towards us, that which was already done; but hoped well, that the nature of the sickness of our Men was not infectious. So he returned, and a while after came the *Notary* to us aboard our Ship, holding in his hand a Fruit of that Countrey like an *Orange*, but of colour between *Orange-tawny* and *Scarlet*, which cast a most excellent Odor: He used it (as it seemeth) for a Preservative against Infection. He gave us our Oath, *By the Name of Jesus, and his Merits*; and after told us, that the next day by six of the clock in the morning we should be sent to, and brought to the *Strangers House*, (so he called it) vvhether we should be accommodated of things both for our vvhole and for our sick. So he left us; and vvhether we offered him some Pistolets, he smiling, said, *He must not be twice paid for one labor*, meaning (as I take it) that he had salary sufficient of the State for his service; for (as I after learned) they call an Officer that taketh revvards, *Twice paid*.

The next morning early, there came to us the same Officer that came to us at first vvhith his Cane, and told us, "He came to conduct us to the *Strangers House*, and that he had prevented the hour, because we might have the whole day before us for our business: For (*said he*) if you vvhill follow my advice, there shall first go vvhith me some fevv of you, and see the place, and how it may be made convenient for you; and then you may send for your sick, and the rest of your number which ye will bring on Land. VVe thanked him, and said, "That this care vvhich he took of desolate Strangers, God vvhould revvard. And so six of us vvent on Land vvhith him; and vvhether we were on Land, he vvent before us, and turned to us, and said, *He was but our Servant, and our Guide*. He led us through three fair Streets, and all the way we went there were gathered some people on both sides, standing in a row, but in so civil a fashion, as if it had been not to wonder at us, but to welcome us; and divers of them, as we passed by them, put their arms a little abroad, which is their gesture when they bid any welcome. The *Strangers House* is a fair and spacious House, built of Brick, of somewhat a bluer colour then our Brick, and with handsome Windows, some of Glasse, some of a kinde of Cambrick oiled. He brought us first into a fair Parlor above-stairs, and then asked us, "What number of persons we were, and how many sick. VVe answered, "We were in all (sick and whole) One and fifty persons, whereof our sick were seventeen. He desired us to have patience a little, and to stay till he came back to us, which was about an hour after; and then he led us to see the Chambers which were provided for us, being in number Nineteen. They having cast it (as it seemeth) that four of those Chambers, vvhich were better then the rest, might receive four of the principal men of our company, and lodge them alone by themselves; and the other fifteen Chambers were to lodge us, two and two together; the Chambers were handsome and chearful Chambers, and furnished civilly. Then he led us to a long Gallery, like a Dorture, vvhether he shevved us all along the one side (for the other side was but Wall and Window) seventeen Cells, very neat ones, having Partitions of Cedar-wood. VVhich Gallery and Cells, being in all

all forty, (many more then we needed) were instituted as an Infirmary for sick persons. And he told us withal, that as any of our sick waxed well, he might be removed from his Cell to a Chamber; for which purpose, there were set forth ten spare Chambers, besides the number we spake of before. This done, he brought us back to the Parlor, and lifting up his Cane a little (as they do when they give any charge or command) said to us, "Ye are to know, that the Custom of the Land requireth, that after this day and to morrow (which we give you for removing your People from your Ship) you are to keep within doors for three days: But let it not trouble you, nor do not think your selves restrained, but rather left to your Rest and Ease. You shall want nothing, and there are six of our people appointed to attend you for any business you may have abroad. We gave him thanks with all affection and respect, and said; *God surely is manifested in this Land.* We offered him also twenty Pistolets; but he smiled, and onely said, *What, twice paid?* and so he left us. Soon after our Dinner was served in, which was right good Viands, both for Bread and Meat, better then any Collegiate Diet, that I have known in *Europe.* VVe had also drink of three sorts. all wholesome and good; VVine of the Grape, a Drink of Grain, such as is with us our Ale, but more clear; and a kinde of Sider made of a Fruit of that Countrey, a wonderful pleasing and refreshing drink. Besides, there were brought in to us great store of those Scarlet Orengees for our sick, which (they said) were an assured remedy for sickness taken at Sea. There was given us also a Box of small gray or whitish Pills, which they wished our sick should take, one of the Pills every night before sleep, which (they said) would hasten their recovery. The next day, after that our trouble of carriage and removing of our Men and Goods out of our Ship, was somewhat settled and quiet, I thought good to call our company together, and when they were assembled, said unto them, "My dear Friends, let us know our selves, and how it standeth with us. VVe are Men cast on Land, as *Jonas* was out of the VVhales Belly, when we were as buried in the deep; and now we are on Land, we are but between Death and Life, for we are beyond both the Old VVorld and the New, and whether ever we shall see *Europe,* God onely knoweth: It is a kinde of miracle hath brought us hither, and it must be little less that shall bring us hence. Therefore in regard of our deliverance past, and our danger present and to come, let us look up to God, and every man reform his own ways. Besides, we are come here amongst a *Christian People,* full of Piety and Humanity; let us not bring that confusion of face upon our selves, as to shew our vices or unworthiness before them. Yet there is more; for they have by commandment (though in form of courtesie) cloistered us within these VValls for three days; vvhoe knoweth vvhether it be not to take some taste of our manners and conditions; and if they finde them bad, to banish us straight-vvays; if good, to give us further time? For these men that they have given us for attendance, may vvitall have an eye upon us. Therefore for Gods love, and as vve love the vveal of our Souls and Bodies, let us so behave our selves as vve may be at peace vvitth God, and may finde grace in the eyes of this people. Our Company vvitth one voice thanked me for my good admonition, and promised me to live soberly and civilly, and vvitout giving any the least occasion of offence. So vve spent our three days joyfully and vvitout care, in expectation vvhath vvhould be done vvitth us vvhether they vvere expired: During vvhich time, vve had every hour joy
of

of the amendment of our sick, who thought themselves cast into some divine *Pool of Healing*, they mended so kindly and so fast.

The morrow after our three days were past, there came to us a new Man that we had not seen before, clothed in blew as the former was, save that his Turbant was white with a small Red Cross on the top; he had also a Tippet of fine Linnen. At his coming in he did bend to us a little, and put his arms abroad. We of our parts saluted him in a very lowly and submissive manner, as looking, that from him we should receive sentence of Life or Death. He desired to speak with some few of us; wherupon six of us onely staid, and the rest avoided the room. He said, "I am by office Governor of this *House of Strangers*, and by Vocation I am a *Christian Priest*; and therefore am come to you to offer you my service, both as Strangers, and chiefly as *Christians*. Some things I may tell you, which I think you will not be unwilling to hear. The State hath given you licence to stay on Land for the space of six weeks; and let it not trouble you, if your occasions ask further time, for the Law in this Point is not precise; and I do not doubt, but my self shall be able to obtain for you such further time as shall be convenient. Ye shall also understand, that the *Strangers House* is at this time rich and much aforehand, for it hath laid up Revenue these Thirtie seven years; for so long it is since any Stranger arrived in this part: And therefore take ye no care, the State will defray you all the time you stay, neither shall you stay one day less for that. As for any Merchandize you have brought, ye shall be well used, and have your Return, either in Merchandize, or in Gold and Silver; for to us it is all one. And if you have any other request to make, hide it not, for ye shall finde we will not make your countenance to fail by the answer ye shall receive. Onely this I must tell you, that none of you must go above a *Karan* (that is with them a mile and an halfe) from the Walls of the City without special leave. We answered, after we had looked a while upon one another, admiring this gracious and parent-like usage. "That we could not tell what to say, for we wanted words to express our thanks, and his noble free offers left us nothing to ask. It seemed to us, that we had before us a Picture of our *Salvation* in *Heaven*; for we that were a while since in the Jaws of Death, were now brought into a place where we found nothing but Consolations. For the Commandment laid upon us, we would not fail to obey it, though it was impossible but our hearts should be inflamed to tread further upon this happy and holy Ground. We added, "That our Tongues should first cleave to the Roofs of our Mouths, ere we should forget either this Reverend Person, or this whole Nation, in our Prayers. We also most humbly besought him to accept of us as his true Servants, by as just a right as ever Men on Earth were bounden, laying and presenting both our persons and all we had at his feet. He said, *He was a Priest, and looked for a Priests reward, which was our Brotherly love, and the good of our Souls and Bodies*. So he went from us, not without tears of tenderness in his eyes; and left us also confused with joy and kindness, saying amongst our selves, *That yve were come into a Land of Angels, which did appear to us daily, and prevent us with comforts which we thought not of, much less expected*.

The next day about ten of the clock the Governor came to us again, and after salutations, said familiarly, *That he was come to visit us*, and called for a Chair, and sat him down; and we being tometen of us (the rest were of the meaner sort, or else gone abroad) sit down with him: And when we were set, he began thus, "We of this Island of *Bensalem* (for so they call it in
their

“ *their Language,*) have this, That by means of our solitary situation, and of
 “ the Laws of Secrecy which we have for our Travellers, and our rare
 “ admission of strangers, we know well most part of the Habitable World,
 “ and are our selves unknown. Therefore, because he that knoweth least,
 “ is fittest to ask Questions, it is more reason, for the entertainment of the
 “ time, that ye ask me Questions, than that I ask you. *We answered,* That
 “ we humbly thanked him, that he would give us leave so to do, and that
 “ we conceived by the taste we had already, that there was no worldly thing
 “ on Earth, more worthy to be known, then the state of that happy Land.
 “ But above all (*we said*) since that we were met from the several Ends of
 “ the World; and hoped assuredly, that we should meet one day in the
 “ Kingdom of Heaven, (for that we were both parts *Christians*) we desired
 “ to know (in respect that Land was so remote, and so divided by vast and
 “ unknown Seas, from the Land where our *Saviour* walked on Earth)
 “ who was the Apostle of that Nation, and how it was converted to the
 “ Faith. *It appeared in his face, that he took great contentment in this our Question. He*
 “ *said,* “ Ye knit my heart to you by asking this Question in the first place,
 “ for it sheweth that you *first seek the Kingdom of Heaven;* and I shall gladly and
 “ briefly satisfy your demand.

“ About twenty years after the Ascension of our *Saviour,* it came to
 “ pass, that there was seen by the people of *Rensusa* (a City upon the
 “ Eastern Coast of our Island) within night (the night was cloudy and
 “ calm) as it might be some mile in the Sea, a great *Pillar of Light,* not sharp,
 “ but in form of a Column or Cylinder, rising from the Sea a great way up
 “ towards Heaven, and on the top of it was seen a large *Cross of Light,* more
 “ bright and resplendent then the Body of the Pillar: Upon which so
 “ strange a spectacle the people of the City gathered apace together upon
 “ the Sands to wonder, and so after put themselves into a number of small
 “ Boats to go nearer to this marvellous sight. But when the Boats were
 “ come within (about) sixty yards of the Pillar, they found themselves all
 “ bound, and could go no further, yet so as they might move to go about,
 “ but might not approach nearer; so as the Boats stood all as in a Theatre,
 “ beholding this Light as an Heavenly Sign. It so fell out, that there was in
 “ one of the Boats, one of the wise Men of the Society of *Solomons House,*
 “ (which *House* or *College* (my good Brethren) is the very Eye of this King-
 “ dom) who having a while attentively and devoutly viewed and contem-
 “ plated this Pillar and Cross, fell down upon his face, and then raised him-
 “ self upon his knees, and lifting up his hands to Heaven made his Prayers
 “ in this manner.

Lord God of Heaven and Earth, thou hast vouch-
 safed of thy Grace to those of our Order, to know thy
 Works of Creation, and true Secrets of them, and to
 discern (as far as appertaineth to the Generations of Men)
 between Divine Miracles, Works of Nature, Works
 of Art, and Impostures and Illusions of all sorts. I do here
 acknowledge and testify before this People, that the Thing
 we

we now see before our eyes is thy Finger, and a true Miracle. And forasmuch as we learn in our Books, that thou never workest Miracles but to a Divine and excellent End, (for the Laws of Nature, are thine own Laws, and thou exceedest them not but upon good cause) we most humbly beseech thee to prosper this great Sign, and to give us the Interpretation, and use of it in mercy, which thou dost in some part secretly promise, by sending it unto us.

“ When he had made his Prayer, he presently found the Boat he was
 “ in, moveable and unbound, whereas all the rest remained still fast; and
 “ taking that for an assurance of leave to approach, he caused the Boat to be
 “ softly, and with silence, rowed towards the Pillar; but ere he came near it,
 “ the Pillar and Cross of Light brake up, and cast it self abroad, as it were, into
 “ a Firmament of many Stars; which also vanished soon after, and there was
 “ nothing left to be seen but a small Ark or Chest of Cedar, dry, and not wet
 “ at all with Water, though it swam; and in the fore-end of it, which was
 “ towards him, grew a small green Branch of Palm. And when the Wite-
 “ man had taken it with all reverence into his Boat, it opened of it self, and
 “ there was found in it a Book and a Letter, both written in fine Parchment,
 “ and wrapped in Sindons of Linnen. The Book contained all the Canonical
 “ Books of the Old and New Testament, according as you have them, (for we
 “ know well what the Churches with you receive;) and the Apocalypse it self,
 “ and some other Books of the New Testament, which were not at that time
 “ written, were nevertheless in the Book. And for the Letter, it was in these
 “ words.

I Bartholomew, a Servant of the Highest, and
 Apostle of *JESUS CHRIST*, was warn-
 ed by an Angel that appeared to me in a
 Vision of Glory, that I should commit this
 Ark to the Flouds of the Sea. Therefore I
 do testifie and declare unto that People, where
 GOD shall ordain this Ark to come to Land,
 that in the same day is come unto them Salva-
 tion, and Peace, and Good Will from the
 FATHER, and from the LORD *JESUS*.

“ There was also in both these Writings, as well the Book as the
 “ Letter, wrought a great Miracle, conform to that of the Apostles in the
 “ Original Gift of Tongues. For there being at that time in this Land Hebrews,
 “ Persians, and Indians, besides the Natives, every one read upon the Book
 “ and

“and *Letter*, as if they had been written in his own Language. And thus
 “was this Land saved from Infidelity (as the Remain of the old World
 “was from Water) by an Ark, through the Apostolical and Miraculous
 “Evangelism of *S. Bartholomevv*. And here he paused, and a Messenger
 came and called him forth from us. So this was all that passed in that
 Conference.

The next day the same Governor came again to us immediately after Dinner, and excused himself, saying, “That the day before he was called from us
 “somewhat abruptly, but now he would make us amends, and spend time
 “with us, if we held his Company and Conference agreeable. *We answered*,
 “That we held it so agreeable and pleasing to us, as we forgot both dangers
 “past and fears to come, for the time we heard him speak, and that we
 “thought an hour spent with him, was worth years of our former life. *He*
bovved himself a little to us, and after vve were set again, he said, “Well, the *Questi-*
 “ons are on your part. *One of our number said, after a little pause*, “That there
 “was a matter we were no less desirous to know then fearful to ask, lest we
 “might presume too far; but encouraged by his rare Humanity towards us,
 “(that could scarce think our selves strangers, being his vowed and professed
 “Servants) we would take the hardiness to propound it: Humbly beseech-
 “ing him, if he thought it not fit to be answered, that he would pardon it,
 “though he rejected it. *VVe said*, We well observed those his words
 “which he formerly spake, That this happy Island where we now stood
 “was known to few, and yet knew most of the Nations of the World;
 “which we found to be true, considering they had the Languages of
 “*Europe*, and knew much of our state and business; and yet we in *Europe*
 “(notwithstanding all the remote Discoveries and Navigations of this last
 “Age) never heard any of the least inkling or glimpse of this Island. This
 “we found wonderful strange, for that all Nations have interknowledge
 “one of another, either by Voyage into Foreign Parts, or by Strangers
 “that come to them: And though the Traveller into a Foreign Countrey,
 “doth commonly know more by the Eye, then he that staid at home can
 “by relation of the Traveller; yet both ways suffice to make a mutual
 “knowledge in some degree on both parts: But for this Island, we never
 “heard tell of any Ship of theirs that had been seen to arrive upon any
 “shore of *Europe*, no nor of either the *East* or *West-Indies*, nor yet of any
 “Ship of any other part of the World that had made return for them. And
 “yet the marvel rested not in this; for the situation of it (as his Lordship
 “said) in the secret Conclave of such a vast Sea might cause it: But then,
 “that they should have knowledge of the Languages, Books, Affairs of
 “those that lie such a distance from them, it was a thing we could not tell
 “what to make of; for that it seemed to us a condition and propriety of
 “Divine Powers and Beings, to be hidden and unseen to others, and yet
 “to have others open, and as in a light to them. At this Speech the Go-
 vernor gave a gracious smile, and said, “That we did well to ask pardon
 “for this Question we now asked, for that it imported as if we thought
 “this Land, a Land of Magicians, that sent forth Spirits of the Air into all
 “parts to bring them news, and intelligence of other Countreys. It was
 answered by us all, in all possible humbleness, but yet with a countenance
 taking knowledge, that we knew, that he spake it but merrily, “That we
 “were apt enough to think, there was somewhat supernatural in this
 “Island, but yet rather as Angelical then Magical. But to let his Lord-
 “ship know truly what it was that made us tender and doubtful to ask this
 “Question,

“ Question : it was not any such conceit, but because we remembered he
 “ had given a touch in his former Speech, that this Land had Laws of Se-
 “ crecy, touching Strangers. To this he said, “ You remember it right; and
 “ therefore in that, I shall say to you, I must reserve some particulars which
 “ it is not lawful for me to reveal, but there will be enough left to give you
 “ satisfaction.

“ You shall understand (that which perhaps you will scarce think cre-
 “ dible) that about Three thousand years ago, or somewhat more, the Na-
 “ vigation of the VWorld (specially for remote Voyages) was greater then
 “ at this day. Do not think with your selves, that I know not how much
 “ it is increased with you within these threescore years, I know it well; and
 “ yet I say, greater then then now. VWhether it was, that the example of
 “ the Ark that saved the remnant of Men from the Universal Deluge, gave
 “ men confidence to adventure upon the VVaters, or what it was, but such
 “ is the truth. The *Phenicians*, and specially the *Tyrians*, had great Fleets;
 “ so had the *Carthaginians* their Colony, which is yet further VWest: To-
 “ ward the East the Shipping of *Egypt* and of *Palestina* was likewise great;
 “ *China* also, and the *Great Atlantis* (that you call *America*) which have now
 “ but Junks and Canoes, abounded then in tall Ships. This Island (as
 “ appeareth by faithful Registers of those times) had then Fifteen hundred
 “ strong Ships of great content. Of all this, there is with you sparing memory
 “ or none, but we have large knowledge thereof.

“ At that time this Land was known, and frequented by the Ships and
 “ Vessels of all the Nations before named and (as it cometh to pass) they
 “ had many times Men of other Countreys that were no Sailors, that came
 “ with them, as *Persians*, *Chaldeans*, *Arabians*; so as almost all Nations of
 “ might and fame resorted hither, of whom we have some Stirps and little
 “ Tribes with us at this day. And for our own Ships, they went sundry
 “ Voyages, as well to your *Streights*, which you call the *Pillars of Hercules*,
 “ as to other parts in the *Atlantick* and *Mediterranean Seas*; as to *Peguim* (which
 “ is the same with *Cambalu*) and *Quinsay* upon the *Oriental Seas*, as far as to
 “ the Borders of the *East Tartary*.

“ At the same time, and an Age after or more, the Inhabitants of the
 “ *Great Atlantis* did flourish. For though the Narration and Description
 “ which is made by a great Man with you, of the Descendents of *Neptune*
 “ planted there, and of the magnificent Temple, Palace, City, and Hill,
 “ and the manifold streams of goodly Navigable Rivers, which (as so many
 “ Chains) invironed the same Site and Temple, and the several degrees of
 “ ascent, whereby men did climb up to the same, as if it had been a *Scala*
 “ *Cæli*, be all Poetical and Fabulous; yet so much is true That the said
 “ Countrey of *Atlantis*, as well that of *Peru* then called *Coya*, as that of
 “ *Mexico* then named *Tyrambel*; were mighty and proud Kingdoms in
 “ Arms, Shipping, and Riches; so mighty, as at one time (or a least with-
 “ in the space of ten years) they both made two great expeditions, they of
 “ *Tyrambel* through the *Atlantick* to the *Mediterranean Sea*, and they of *Coya*
 “ through the South-sea upon this our Island. And for the former of these,
 “ which was into *Europe*, the same Author amongst you (as it seemeth) had
 “ some relation from the *Egyptian Priest* whom he citeth, for assuredly such
 “ a thing there was. But whether it were the ancient *Athenians* that had
 “ the glory of the repulse and resistance of those Forces, I can say nothing;
 “ but certain it is, there never came back either Ship or Man from that Voy-
 “ age. Neither had the other Voyage of those of *Coya*, upon us, had better

" fortune, if they had not met with enemies of greater clemency. For the
 " King of this Island (by name *Atabin*) a wise Man, and a great Warrior,
 " knowing well both his own strength, and that of his enemies; handled the
 " matter so, as he cut off their Land forces from their Ships, and entailed
 " both their Navy and their Camp, with a greater power than theirs, both
 " by Sea and Land, and compelled them to render themselves without
 " striking stroke; and after they were at his mercy, contenting himself one-
 " ly with their Oath, that they should no more bear Arms against him, dis-
 " missed them all in safety. But the Divine revenge overtook not long
 " after those proud enterprises; for within less then the space of One hun-
 " dred years the *Great Atlantis* was utterly lost and destroyed, not by a great
 " Earthquake, as your *Man* saith, (for that whole Tract is little subject to
 " Earthquakes) but by a particular Deluge or Inundation, those Countreys
 " having at this day far greater Rivers; and far higher Mountains to pour
 " down Waters, than any part of the Old World. But it is true, that the
 " same Inundation was not deep, not past forty foot in most places from
 " the ground; so that although it destroyed Man and Beast generally,
 " yet some few wilde Inhabitants of the Wood escaped: Birds also were
 " saved by flying to the high Trees and Woods. For as for Men, although
 " they had Buildings in many places higher then the depth of the *VV*ater;
 " yet that Inundation, though it were shallow, had a long continuance,
 " whereby they of the Vale, that were not drowned, perished for want of
 " food, and other things necessary. So as marvel you not at the thin Popu-
 " lation of *America*, nor at the Rudeness and Ignorance of the People; for
 " you must account your Inhabitants of *America* as a young People,
 " younger a thousand years at the least than the rest of the *VV*orld, for
 " that there was so much time between the Universal Flood, and their par-
 " ticular Inundation. For the poor remnant of Humane Seed which re-
 " mained in their Mountains peopled the Countrey again slowly, by little
 " and little: And being simple and a savage people (not like *Noah* and his
 " Sons, which was the chief Family of the Earth) they were not able to
 " leave Letters, Arts, and Civility to their Posterity. And having likewise
 " in their Mountainous Habitations been used (in respect of the extream
 " Cold of those Regions) to cloath themselves with the skins of *Tigers*,
 " *Bears*, and great *Hairy Goats*, that they have in those parts; when after
 " they came down into the Valley, and found the intolerable Heats which
 " are there, and knew no means of lighter Apparel, they were forced to
 " begin the custom of going naked, which continueth at this day; onely
 " they take great pride and delight in the Feathers of Birds: And this also
 " they took from those their Ancestors of the Mountains, who were in-
 " vited unto it by the infinite flight of Birds that came up to the high
 " Grounds, while the Waters stood below. So you see by this main
 " accident of time, we lost our Traffick with the *Americans*, with whom,
 " of all others, in regard they lay nearest to us, we had most commerce.
 " As for the other parts of the World, it is most manifest, that in the
 " Ages following (whether it were in respect of *VV*ars, or by a Natural
 " revolution of time) Navigation did every where greatly decay, and
 " especially far voyages (the rather by the use of Gallies, and such Vessels
 " as could hardly brook the Ocean) were altogether left and omitted.
 " So then, that part of intercourse which could be from other Nations
 " to fall to us, you see how it hath long since ceased, except it were by
 " some rare accident, as this of yours. But now of the cessation of that
 " other

“ other part of intercourse, which might be by our sailing to other Nations;
 “ I must yield you some other cause: For I cannot say (if I should say truly)
 “ but our shipping for number, strength, Mariners, Pilot, and all things that
 “ appertain to Navigation, is as great as ever; and therefore why we should
 “ sit at home, I shall now give you an account by it self, and it will draw nearer
 “ to give you satisfaction to your principal Question.

“ There reigned in this Island about One thousand nine hundred years
 “ ago, a King, whose memory of all others we most adore, not superstitiously,
 “ but as a Divine Instrument, though a Mortal Man; his name was *Salomona*;
 “ and we esteem him as the Law-giver of our Nation. This King had a large
 “ heart inscrutable for good, and was wholly bent to make his Kingdom and
 “ People happy: He therefore taking into consideration, how sufficient and
 “ substantive this Land was to maintain it self without any aid (at all) of the
 “ Foreigner, being Five thousand six hundred miles in circuit, and of rare
 “ fertility of soil in the greatest part thereof; and finding also the shipping of
 “ this Countrey might be plentifully set on work, both by Fishing, and by
 “ Transportations from Port to Port, and likewise by sailing unto some small
 “ Islands that are not far from us, and are under the Crown and Laws of this
 “ State; and recalling into his memory the happy and flourishing estate
 “ wherein this Land then was, so as it might be a thousand ways altered to
 “ the worse, but scarce any one way to the better; thought nothing wanted
 “ to his Noble and Heroical Intentions, but onely (as far as Humane fore-
 “ sight might reach) to give perpetuity to that which was in his time so happily
 “ established; therefore amongst his other Fundamental Laws of this King-
 “ dom, he did ordain the Interdicts and Prohibitions which we have touch-
 “ ing entrance of strangers, which at that time (though it was after the cala-
 “ mity of *America*) was frequent, doubting novelties and commixture of
 “ manners. It is true, the like Law against the admission of strangers, with-
 “ out licence, is an ancient Law in the Kingdom of *China*, and yet continued
 “ in use; but there it is a poor thing, and hath made them a curious, igno-
 “ rant, fearful, foolish Nation. But our Law-giver made his Law of another
 “ temper. For first, he hath preserved all points of humanity, in taking or-
 “ der and making provision for the relief of strangers distressed, whereof you
 “ have tasted. *At which Speech (as reason was) we all rose up and bowed ourselves.*
 “ *He went on.* “ That King also still desiring to joyn Humanity and Policy to-
 “ gether, and thinking it against Humanity to detain Strangers here against
 “ their Wills, and against Policy, that they should return and discover their
 “ knowledge of this State, he took this course. He did ordain, that of the
 “ Strangers that should be permitted to Land, as many (at all times) might
 “ depart as would, but as many as would stay, should have very good con-
 “ ditions and means to live from the State. Wherein he saw so far, that
 “ now in so many Ages, since the Prohibition, we have memory not of one
 “ Ship that ever returned, and but of thirteen persons onely at several times
 “ that chose to return in our Bottoms. What those few that returned, may
 “ have reported abroad, I know not; but you must think, whatsoever they
 “ have said, could be taken where they came, but for a dream. Now for
 “ our travelling from hence into parts abroad, our Law-giver thought fit al-
 “ together to restrain it. So is it not in *China*, for the *Chineses* sail where they
 “ will, or can; which sheweth, that their Law of keeping our Strangers, is
 “ a Law of pusillanimity and fear. But this restraint of ours hath one onely
 “ exception, which is admirable, preserving the good which cometh by
 “ communicating with strangers, and avoiding the hurt; and I will now

" open it to you. And here I shall seem a little to digress, but you will by
 " and by finde it pertinent. Ye shall understand (my dear Friends) that
 " amongst the excellent acts of that King, one above all hath the preemi-
 " nence: It was the erection and institution of an Order or Society which
 " we call *Solomons House*, the noblest Foundation (as we think) that ever
 " was upon the Earth, and the Lanthorn of this Kingdom. It is dedicated
 " to the study of the Works and creatures of God. Some think it beareth
 " the Founders name a little corrupted, as if it should be *Solomons House*;
 " but the Records write it as it is spoken, so as I take it to be denomi-
 " nate of the King of the *Hebrews*, which is famous with you, and no stranger
 " to us; for we have some parts of his Works which with you are lost,
 " namely, that *Natural History* which he wrote of all Plants, from the *Cedar*
 " of *Libanus* to the *Moss that groweth out of the Wall*, and of all things that have
 " *Life and Motion*. This maketh me think that our King finding himself to
 " symbolize in many things with that King of the *Hebrews* (which lived
 " many years before him) honored him with the Title of this Foundation.
 " And I am the rather induced to be of this opinion, for that I finde in an-
 " cient Records this Order or Society is sometimes called *Solomons House*,
 " and sometimes *The Colledge of the Six days Works*; whereby I am satisfied,
 " that our Excellent King had learned from the *Hebrews*, that God had
 " created the World, and all that therein is within Six days; and therefore
 " he instituting that House for the finding out of the true Nature of all
 " things (whereby God might have the more glory in the workmanship of
 " them, and Men the more Fruit in their use of them) did give it also that
 " second name. But now to come to our present purpose.

" When the King had forbidden to all his People Navigation in any
 " part that was not under his Crown, he made nevertheless this Ordinance,
 " That every twelve years there should be set forth out of this Kingdom
 " two Ships appointed to several Voyages; that in either of these Ships,
 " there should be a Mission of three of the Fellows or Brethren of *Solomons*
 " *House*, whose errand was onely to give us knowledge of the affairs and
 " state of those Countreys, to which they were designed, and especially of the
 " Sciences, Arts, Manufactures and Inventions of all the World; and withal
 " to bring unto us Books, Instruments, and Patterns in every kinde. That
 " the Ships after they had landed the Brethren should return, and that the
 " Brethren should stay abroad till the new Mission. The Ships are not other-
 " wise fraught than with store of Victuals, and good quantity of Treasure,
 " to remain with the Brethren for the buying of such things, and rewarding
 " of such persons as they should think fit. Now for me to tell you how the
 " vulgar sort of Mariners are contained from being discovered at Land,
 " and how they that must be put on shore for any time colour themselves
 " under the names of other Nations, and to what places these Voyages have
 " been designed, and what places of Rendezvous are appointed for the new
 " Missions, and the like circumstances of the practick, I may not do it, neither
 " is it much to your desire. But thus you see we maintain a Trade, not for
 " Gold, Silver, or Jewels, nor for Silks, nor for Spices, nor any other com-
 " modity of Matter, but onely for Gods first Creature, which was Light; to
 " have Light (I say) of the growth of all parts of the World. And when he
 " had said this, he was silent, and so were we all; for indeed, we were all astonish-
 " ed to hear so strange things so probably told. And he perceiving, that we
 " were willing to say somewhat, but had it not ready, in great courtesie,
 " took us off, and descended to ask us Questions of our Voyage and Fortunes;
 " and

and in the end concluded, that we might do well to think with our selves what time of stay we would demand of the State; and bad us not to scant our selves, for he would procure such time as we desired. Whereupon we all rose up and presented our selves to skiss the skirt of his Tippet; but he would not suffer us, and so took his leave. But when it came once amongst our people, that the State used to offer conditions to strangers that would stay, we had work enough to get any of our men to look to our Ship, and to keep them from going presently to the Governour to crave conditions; but with much ado, we refrained them till we might agree what course to take.

We took our selves now for Freeman, seeing there was no danger of our utter perdition, and lived most joyfully, going abroad, and seeing what was to be seen in the City and places adjacent within our *Tedder*, and obtaining acquaintance with many of the City, not of the meanest quality, at whose hands we found such humanity, and such a freedom and desire to take strangers, as it were into their bosom, as was enough to make us forget all that was dear to us in our own Countreys, and continually we met with many things right worthy of observation and relation: As indeed, if there be a Mirror in the World, worthy to hold mens eyes, it is that Countrey. One day there were two of our company bidden to a Feast of the *Family*, as they call it; almost natural, pious and reverend custom it is, shewing that Nation to be compounded of all goodness. This is the manner of it. It is granted to any man that shall live to see thirty persons descended of his body alive together, and all above three years old, to make this Feast, which is done at the cost of the State. The *Father* of the *Family*, whom they call the *Tirfan*, two days before the Feast taketh to him three of such Friends as he liketh to chuse, and is assisted also by the Governour of the City or place where the Feast is celebrated; and all the Persons of the *Family* of both Sexes are summoned to attend him. These two days the *Tirfan* sitteth in consultation concerning the good estate of the *Family*; there, if there be any Discord or Suits between any of the *Family*, they are compounded and appeased; there, if any of the *Family* be distressed or decayed, order is taken for their relief and competent means to live; there, if any be subject to vice or take ill courses, they are reprov'd and censured. So likewise, direction is given touching Marriages, and the courses of life which any of them should take, with divers other the like orders and advices. The Governour assisteth to the end, to put in execution by his publick Authority, the Decrees and Orders of the *Tirfan*; if they should be disobey'd, though that seldom needeth; such reverence and obedience they give to the order of Nature. The *Tirfan* doth also then ever chuse one man from amongst his Sons to live in House with him; who is called ever after the *Son of the Vine*; the reason will hereafter appear. On the Feast-day, the *Tather* or *Tirfan* cometh forth after Divine Service into a large Room where the Feast is celebrated; which Room hath an Halfpace at the upper end. Against the Wall, in the middle of the Halfpace, is a Chair placed for him, with a Table and Carpet before it: Over the Chair is a State made round or oval, and it is of Ivy; an Ivy somewhat whiter then ours, like the Leaf of a Silver Asp, but more shining, for it is Green all Winter. And the State is curiously wrought with Silver and Silk of divers colours, broiding or binding in the Ivy; and is ever of the work of some of the Daughters of the *Family*, and veiled

over at the top with a fine Net of Silk and Silver: But the substance of it is true Ivy, whereof, after it is taken down, the Friends of the Family are desirous to have some Leaf or Sprig to keep. The *Tirfan* cometh forth with all his Generation or Lineage, the Males before him, and the Females following him. And if there be a Mother, from whose body the whole Lineage is descended, there is a Traverse placed in a Loft above on the right hand of the Chair, with a Privy Door, and a carved Window of Glass, leaded with Gold and Blew, where she sitteth, but is not seen. When the *Tirfan* is come forth, he sitteth down in the Chair, and all the Lineage place themselves against the Wall, both at his back, and upon the return of the Half-pace, in order of their years, without difference of Sex, and stand upon their Feet. When he is set, the room being always full of company, but well kept, and without disorder, after some pause there cometh in from the lower end of the room a *Taratan*, (which is as much as an *Herauld*) and on either side of him two young Lads, whereof one carrieth a Scroul of their shining yellow Parchment, and the other a cluster of Grapes of Gold, with a long foot or stalk: The Herauld and Children are clothed with Mantles of Sea-water-green Sattin, but the Heraulds Mantle is streamed with Gold, and hath a Train. Then the Herauld, with three Courtesies, or rather Inclinations, cometh up as far as the Half pace, and there first taketh into his hand the Scroul. This Scroul is the Kings Charter, containing Gift of Revenue, and many Priviledges, Exemptions, and Points of Honor granted to the Father of the Family; and it is ever stiled and directed, *To such an one, Our beloved Friend and Creditor*, which is a Title proper onely to this case: For they say, the King is Debtor to no Man, but for propagation of his Subjects. The Seal set to the Kings Charter, is the Kings Image imbossed or moulded in Gold. And though such Charters be expedited of course, and as of right, yet they are varied by discretion, according to the number and dignity of the Family. This Charter the Herauld readeth aloud; and while it is read, the *Father* or *Tirfan* standeth up, supported by two of his Sons, such as he chuseth. Then the Herauld mounteth the Half-pace, and delivereth the Charter into his hand, and with that there is an acclamation by all that are present in their Language, which is thus much, *Happy are the People of Bensalem*. Then the Herauld taketh into his hand from the other Childe the cluster of Grapes, which is of Gold, both the Salk and the Grapes; but the Grapes are daintily enamelled: And if the Males of the Family be the greater number, the Grapes are enamelled Purple, with a little Sun set on the top; if the Females, then they are enamelled into a greenish yellow, with a Crescent on the top. The Grapes are in number as many as there are Descendants of the Family. This Golden Cluster the Herauld delivereth also to the *Tirfan*, who presently delivereth it over to that Son that he had formerly chosen to be in houle with him; who beareth it before his Father as an Ensign of Honor when he goeth in publick ever after, and is thereupon called *The Son of the Vine*. After this Ceremony ended, the *Father* or *Tirfan* retireth, and after some time cometh forth again to Dinner, where he sitteth alone under the State as before; and none of his Descendants sit with him; of what degree or dignity soever, except he hap to be of *Solomons* House. He is served onely by his own Children, such as are Male, who perform unto him all service of the Table upon the knee; and the Women onely stand about him, leaning against the Wall. The Room below his Half-pace hath

hath Tables on the sides for the Guests that are bidden, who are served with great and comely order; and toward the end of Dinner (which in the greatest Feasts with them, lasteth never above an hour and a half) there is an *Hymn* sung, varied according to the Invention of him that composed it, (for they have excellent Poesie;) but the subject of it is (always) the praises of *Adam*, and *Noah*, and *Abraham*; whereof the former two peopled the World, and the last was the *Father* of the *Faithful*; concluding ever with a Thanksgiving for the Nativity of our *Saviour*, in whose Birth the Births of all are onely Blessed. Dinner being done, the *Tisfan* retireth again, and having withdrawn himself alone into a place, where he maketh some private Prayers, he cometh forth the third time to give the Blessing, with all his Descendants, who stand about him as at the first. Then he calleth them forth, by one and by one, by name, as he pleaseth, though seldom the order of age be inverted. The person that is called (the Table being before removed) kneeleth down before the Chair, and the *Father* layeth his hand upon his head, or her head, and giveth the Blessing in these words; *Son of Bensalem* (or *Daughter of Bensalem*) *thy Father saith it, the Man by whom thou hast breath and life speaketh the word: The Blessing of the Everlasting Father, the Prince of Peace, and the Holy Dove be upon thee, and make the days of thy Pilgrimage good and many.* This he saith to every of them; and that done, if there be any of his Sons of eminent Merit and Vertue, (so they be not above two) he calleth for them again, and saith, laying his arm over their shoulders, they standing, *Sons, it is well you are born; give God the praise, and persevere to the end.* And withal delivereth to either of them a Jewel, made in the figure of an Ear of Wheat, which they ever after wear in the front of their Turbant or Hat. This done, they fall to Musick and Dances, and other Recreations after their manner for the rest of the day. This is the full order of that Feast.

By that time six or seven days were spent, I was faine into straight acquaintance with a Merchant of that City, whose name was *Joabin*; he was a *Jew*, and circumcised: For they have some few stirps of *Jews* yet remaining among them, whom they leave to their own Religion; which they may the better do, because they are of a far differing disposition from the *Jews* in other parts. For whereas they hate the Name of *CHRIST*, and have a secret inbred rancor against the people, among whom they live: These (contrariwise) give unto our *SAVIOUR* many high Attributes, and love the Nation of *Bensalem* extreamly. Surely this Man, of whom I speak, would ever acknowledge that *CHRIST* was born of a Virgin, and that he was more then a Man; and he would tell how *GOD* made him Ruler of the Seraphims which guard his Throne; and they call him also the *Milken way*, and the *Eliab* of the *Messiah*, and many other high Names; which though they be inferior to his *Divine Majesty*, yet they are far from the Language of other *Jews*. And for the Countrey of *Bensalem*, this Man would make no end of commending it, being desirous, by Tradition among the *Jews* there, to have it believed, that the people thereof were of the Generations of *Abraham* by another Son, whom they call *Nachoran*; and that *Moses* by a secret *Cabala* ordained the Laws of *Bensalem*, which they now use; and that when the *Messiah* should come and sit in his Throne at *Jerusalem*, the King of *Bensalem* should sit at his Feet, whereas other Kings should keep a great distance. But yet setting aside these Jewish Dreams, the Man was a wise man and learned, and of great policy, and excellently seen in the Laws and Customs of that Nation.

Nation. Amongst other discourses, one day I told him, I was much affected with the Relation I had from some of the company, of their Custom in holding the Feast of the Family, for that (me thought) I had never heard of a Solemnity wherein Nature did so much preside. And because Propagation of Families proceedeth from the Nuptial Copulation, I desired to know of him what Laws and Customs they had concerning Marriage, and whether they kept Marriage well, and whether they were tied to one Wife. For that where Population is so much affected, and such as with them it seemed to be, there is commonly permission of Plurality of Wives. To this he said, "You have reason for to commend that excellent Institution of the Feast of the Family; and indeed we have experience, that those Families that are partakers of the Blessings of that Feast do flourish and prosper ever after in an extraordinary manner. But hear me now, and I will tell you what I know. You shall understand, that there is not under the Heavens, so chaste a Nation as this of *Bensalem*, nor so free from all pollution or foulness; it is the Virgin of the World. I remember I have read in one of your *European Books* of an holy Hermit amongst you, that desired to see the *Spirit of Fornication*, and there appeared to him a little foul ugly *Aethiope*: But if he had desired to see the *Spirit of Chastity* of *Bensalem*, it would have appeared to him in the likeness of a fair beautiful Cherubin; for there is nothing amongst Mortal Men more fair and admirable, then the chaste Mindes of this People. Know therefore, that with them there are no Stews, no dissolute Houses, no Courtisans, nor any thing of that kinde; nay they wonder (with detestation) at you in *Europe* which permit such things. They say you have put Marriage out of office; for Marriage is ordained a remedy for unlawful concupiscence, and natural concupiscence seemeth as a spur to Marriage: But when Men have at hand a remedy more agreeable to their corrupt will, Marriage is almost expelled. And therefore, there are with you seen infinite Men that marry not, but chuse rather a Libertine, and impure single life, then to be yoaked in Marriage; and many that do marry, marry late, when the prime and strength of their years is past; and when they do marry, what is Marriage to them, but a very Bargain, wherein is sought Alliance, or Portion, or Reputation, with some desire (almost indifferent) of issue, and not the faithful Nuptial Union of Man and Wife that was first instituted? Neither is it possible, that those that have cast away so basely so much of their strength, should greatly esteem Children (being of the same matter) as chaste Men do. So likewise during Marriage, is the case much amended, as it ought to be, if those things were tolerated onely for necessity? No, but they remain still as a very affront to Marriage; the hunting of those dissolute places, or resort to Courtisans, are no more punished in Married men, then in Batchelors: And the depraved custom of change, and the delight in meretricious embraces, (where Sin is turned into Art) maketh Marriage a dull thing, and a kinde of Imposition or Tax. They hear you defend these things as done to avoid greater evils, as Advowtries, Deflowering of Virgins, Unnatural Lust, and the like: But they say this is a preposterous Wisdom; and they call it *Lois* offer, who to save his Guests from abusing offered his Daughters: Nay, they say further, that there is little gained in this, for that the same Vices and Appetites do still remain and abound, Unlawful Lust being like a Furnace, that if you stop the Flames altogether,

gether, it will quench but if you give it any vent, it will rage. As for Masculine Love, they have no touch of it, and yet there are not so faithful and inviolate. Friendships in the World again as are there; and to speak generally (as I said before) I have not read of any such Chastity in any Peoples theirs. *And their usual saying is,* That whosoever is unchaste, cannot reverence himself. *And they say,* That the reverence of a Mans self is, next Religion, the chiefest Bridle of all Vices. And when he had said this, the good Jewv paused a little. Whereupon, I far more willing to hear him speak on, than to speak my self; yet thinking it decent, that upon his pause of Speech I should not be altogether silent, said onely this. "That I would say to him, as the Widow of *Sarepta* said to *Elias*, That he was come to bring to memory our sins; and that I confesse the righteousness of *Bensalem*. was greater than the righteousness of *Europe*. *At vvhich Speech, he bowved his Head, and vvent on in this manner.* "They have also many wise and excellent Laws touching Mariage; they allow no Polygamy; they have ordained, that none do intermarry or contract until a moneth be past from their first interview. Mariage without consent of Parents, they do not make void, but they mulct it in the Inheritors; for the Children of such Mariages are not admitted to inherit above a third part of their Parents Inheritance. I have read in a Book of one of your Men, of a Feigned Commonwealth, where the married couple are permitted before they contract to see one another naked. This they dislike, for they think it a scorn to give a refusal after so familiar knowledge; but because of many hidden defects in Men and Womens Bodies, they have a more civil way; for they have near every Town, a couple of Pools (which they call *Adam and Eves Pools*) where it is permitted to one of the Friends of the Man, and another of the Friends of the Woman, to see them severally bath naked.

And as we were thus in Conference, there came one that seemed to be a Messenger, in a rich Huke, that spake with the Jewv; whereupon he turned to me, and said, *You vvhill pardon me, for I am commanded avway in haste.* The next morning he came to me again, joyful, as it seemed, and said, "There is word come to the Governor of the City, that one of the Fathers of *Solomons House* will be here this day seven-night; we have seen none of them this dozen years. His coming is in state, but the cause of his coming is secre. I will provide you and your Fellows of a good standing to see his entry. I thanked him, and told him, *I was most glad of the newvs.* The day being come, he made his entry. He was a Man of middle stature and age, comely of person, and had an aspect as if he pitied men: He was cloathed in a robe of fine black Cloth, with wide Sleeves, and a Cape; his under Garment was of excellent white Linnen down to the Foot, girt with a Girdle of the same, and a Sindon or Tippet of the same about his Neck; he had Gloves that were curious, and set with Stone, and Shooes of Peach-coloured Velvet; his Neck was bare to the Shoulders; his Hat was like a Helmet or *Spanish Montera*, and his Locks curled below it decently, they were of colour brown; his Beard was cut round, and of the same colour with his Hair, somewhat lighter. He was carried in a rich Chariot without Wheels, Litter-wise, with two Horses at either end, richly trapped in blew Velvet embroidered, and two Footmen on each side in the like attire. The Chariot was all of Cedar, gilt and adorned with Crystal, save that the fore-end had Pannels of Saphires set in borders of Gold, and the hinder-end the like of Emeralds of the *Peru* colour.

There

There was also a Sun of Gold, radiant upon the top in the midst, and on the top before a small Cherub of Gold, with Wings displayed. The Chariot was covered with Cloth of Gold tissued upon blew. He had before him fifty attendants, young men all, in white Satten loose Coats, tip to the mid-leg, and Stockins of white Silk, and Shooes of blew Velvet, and Hats of blew Velvet, with fine Plumes of divers colours set round like Hatbands. Next before the Chariot, went two men bare-headed, in Linnen Garments down to the Foot, girt, and Shooes of blew Velvet, who carried, the one a Crosier, the other a Pastoral Staff like a Sheep-hook, neither of them of Metal, but the Crosier of Balm-wood, the Pastoral Staff of Cedar. Horsemen he had none, neither before, nor behinde his Chariot, as it seemeth, to avoid all tumult and trouble. Behinde his Chariot went all the Officers and Principals of the Companies of the City. He sat alone upon Cushions, of a kinde of excellent Plush, blew, and under his Foot curious Carpets of Silk of divers colours, like the *Persian*, but far finer. He held up his bare hand as he went, as blessing the People, but in silence. The Street was wonderfully well kept, so that there was never any Army had their Men stand in better battel-array, then the people stood. The Windows likewise were not crouded, but every one stood in them, as if they had been placed. When the show was past, the Jew said to me, "I shall not be able to attend you as I would, in regard of some charge the City hath laid upon me for the entertaining of this great Person. Three days after the Jew came to me again, and said, "Ye are happy men, for the Father of *Solomons* House taketh knowledge of your being here, and commanded me to tell you, that he will admit all your company to his presence, and have private conference with one of you that ye shall chuse; and for this, hath appointed the next day after to morrow. And because he meaneth to give you his Blessing, he hath appointed it in the forenoon. We came at our day and hour, and I was chosen by my fellows for the private access. We found him in a fair Chamber richly hanged, and carpeted under Foot, without any degrees to the State: He was set upon a low Throne, richly adorned, and a rich Cloth of State over his head of blew Satten embroidered. He was alone, save that he had two Pages of Honor on either hand one, finely attired in white. His under Garments were the like, that we saw him wear in the Chariot; but instead of his Gown, he had on him a Mantle with a Cape of the same fine Black, fastned about him. When we came in, as we were taught, we bowed low at our first entrance; and when we were come near his Chair, he stood up, holding forth his hand unglowed, and in posture of Blessing; and we every one of us stooped down and kissed the hem of his Tippet. That done, the rest departed, and I remained. Then he warned the Pages forth of the Room, and caused me to sit down beside him, and spake to me thus in the *Spanish* Tongue.

“ **G**OD Bless thee, my Son, I will give thee the greatest Jewel I have; for I will impart unto thee, for the love of God and Men; a Relation of the true state of *Solomons House*. Son, to make you know the true state of *Solomons House*, I will keep this order. First, I will set forth unto you the End of our Foundation. Secondly, The Preparations and Instruments we have for our Works. Thirdly, The several Employments and Functions whereto our Fellows are assigned: And fourthly, The Ordinances and Rites which we observe.

“ The End of our Foundation, is the Knowledge of Causes and Secret Motions of things, and the enlarging of the Bounds of Humane Empire, to the effecting of all things possible.

“ The Preparations and Instruments, are these. We have large and deep Caves of several depths; the deepest are sunk Six hundred fathom, and some of them are digged and made under great Hills and Mountains; so that if you reckon together the depth of the Hill, and the depth of the Cave, they are (some of them) above three miles deep: For we finde that the depth of an Hill, and the depth of a Cave from the Flat, is the same thing, both remote alike from the Sun and Heavens Beams, and from the open Air. These Caves we call the Lower Region, and we use them for all Coagulations, Indurations, Refrigerations, and Conservations of Bodies. We use them likewise for the Imitation of Natural Mines, and the producing also of new Artificial Metals, by Compositions and Materials which we use and lay there for many years. We use them also sometimes (which may seem strange) for curing of some Diseases, and for prolongation of life in some Hermits that chuse to live there, well accommodated of all things necessary, and indeed live very long; by whom also we learn many things.

“ We have Burials in several Earths, where we put divers Cements as the *Chineses* do their Porcellane; but we have them in greater variety and some of them more fine. We also have great variety of Composts and Soils for the making of the Earth fruitful.

“ We have high Towers, the highest about half a mile in height, and some of them likewise set upon high Mountains, so that the vantage of the Hill with the Tower, is in the highest of them, three miles at least. And these places we call the Upper Region, accounting the Air between the high places, and the Low as a Middle Region. We use these Towers, according to their several heights and situations, for Insolation, Refrigeration, Conservation, and for the view of divers Meteors, as Winds, Rain, Snow, Hail, and some of the Fiery Meteors also. And upon them, in some places, are dwellings of Hermits, whom we visit sometimes, and instruct what to observe.

“ We have great Lakes, both salt and fresh, whereof we have use for the Fish and Fowl. We use them also for Burials of some Natural Bodies; for we finde a difference in things buried in Earth, or in Air below the Earth, and things buried in Water. We have also Pools, of which some do strain Fresh Water out of Salt, and others by Art do turn Fresh Water into Salt. We have also some Rocks in the midst of the Sea, and some Bays upon the Shore for some Works, wherein is required the Air and Vapor of the Sea. We have likewise violent streams and cataracts, which serve us for many Motions; and likewise Engins for multiplying and enforcing of Winds, to set also on going divers Motions.

“ We have also a number of artificial Wells and Fountains, made in imitation of the Natural Sources and Baths; as tincted upon Vitriol, Sulphur, Steel, Brass, Lead, Nitre, and other Minerals. And again we have little Wells for Infusions of many things, where the Waters take the virtue quicker and better then in Vessels or Basins: And amongst them we have a Water which we call *Water of Paradise*, being by that we do to it, made very sovereign for Health, and Prolongation of Life.

“ We also great and spacious Houses, where we imitate and demonstrate Meteors; as Snow, Hail, Rain, some Artificial Rains of Bodies, and not of Water, Thunders, Lightnings; also Generations of Bodies in Air, as Frogs, Flies, and divers others.

“ We have also certain Chambers which we call Chambers of Health, where we qualifie the Air, as we think good and proper for the cure of divers Diseases, and preservation of Health.

“ We have also fair and large Baths of several mixtures, for the cure of Diseases, and the restoring of Mans Body from Arefaction; and other, for the confirming of it in strength of Sinews, Vital Parts, and the very Juice and Substance of the Body.

“ We have also large and various Orchards and Gardens, wherein we do not so much respect Beauty, as variety of ground and soyl, proper for divers Trees and Herbs; and some very spacious, where Trees and Berries are set, whereof we make divers kindes of Drinks, besides the Vineyards. In these we practise likewise all conclusions of Grafting and Inoculating, as well of Wild-trees as Fruit-trees, which produceth many effects. And we make (by Art) in the same Orchards and Gardens, Trees and Flowers to come earlier or later then their seasons, and to come up and bear more speedily then by their natural course they do. We make them also (by Art) much greater then their nature, and their Fruit greater and sweeter, and of differing taste, smell, colour and figure from their nature; and many of them we so order, that they become of Medicinal use.

“ VVe have also means to make divers Plants rise, by mixtures of Earths without Seeds, and likewise to make divers new Plants differing from the Vulgar, and to make one Tree or Plant turn into another.

“ VVe have also Parks and Enclosures of all sorts of beasts and Birds; which we use not onely for view or rareness, but likewise for Dissections and Tryals, that thereby we may take light, what may be wrought upon the Body of Man, wherein we finde many strange effects; as continuing life in them, though divers parts, which you account vital, be perished and taken forth; Resuscitating of some that seem dead in appearance, and the like. VVe try also all poysons and other medicines upon them, as well of Chirurgery as Physick. By Art likewise we make them greater or taller then their kind is, and contrariwise dwarf them, and stay their growth: VVe make them more fruitful and bearing, then their kind is, and contrariwise barren, and not generative. Also we make them differ in colour, shape, activity, many ways. VVe finde means to make commixtures and copulations of divers kinds, which have produced many new kinds, and them not barren, as the general opinion is. VVe make a number of kindes of Serpents, VVorms, Flies, Fishes, of Putrefaction; whereof some are advanced (in effect) to be perfect Creatures, like Beasts or Birds, and have Sexes, and do propagate. Neither do we this by chance, but we know beforehand of what matter and commixture what kind of those Creatures will arise.

“ VVe

“ We have also particular Pools where we make tryals upon Fishes,
 “ as we have said before of Beasts and Birds.

“ We have also places for Breed and Generation of those Kinds of
 “ Worms and Flies which are of special use, such as are with you, your
 “ Silk-worms and Bees.

“ I will not hold you long with recounting of our Brew-houses, Bake-
 “ houses and Kitchens, where are made divers Drinks, Breads, and Meats,
 “ rare and of special effects. Wines we have of Grapes, and Drinks of
 “ other Juice, of Fruits, of Grains, and of Roots; and of mixtures with
 “ Honey, Sugar, Manna, and Fruits dried and decocted; also of the Tears
 “ or Woundings of Trees, and of the Pulp of Canes; and these Drinks are
 “ of several Ages, some to the age or last of forty years. VVe have Drinks
 “ also brewed with several Herbs, and Roots, and Spices, yea, with several
 “ Fleshes, and VWhite-meats; whereof some of the Drinks are such as they
 “ are in effect Meat and Drink both; so that divers, especially in Age, do
 “ desire to live with them with little or no Meat or Bread. And above all, we
 “ strive to have Drinks of extream thin parts, to insinuate into the Body,
 “ and yet without all biting, sharpness, or fretting; insomuch, as some of
 “ them put upon the back of your hand, will, with a little stay, pass through
 “ to the palm, and yet taste milde to the mouth. VVe have also VVaters
 “ which we ripen in that fashion as they become nourishing; so that they
 “ are indeed excellent Drink, and many will use no other. Breads we have
 “ of several Grains, Roots and Kernels, yea, and some of Flesh and Fish
 “ dried, with divers kinds of Levenings and Seasonings; so that some do
 “ extreamly move Appetites; some do nourish so, as divers do live of them
 “ without any other Meat, who live very long. So for Meats, we have some
 “ of them so beaten, and made tender and mortified, yet without all cor-
 “ rupting, as a weak heat of the Stomach will turn them into good *Chylus*,
 “ as well as a strong heat would meat otherwise prepared. VVe have some
 “ Meats also, and Breads, and Drinks, which taken by men, enable them to
 “ fast long after; and some other that used, make the very Flesh of Mens
 “ Bodies sensibly more hard and tough, and their strength far greater then
 “ otherwise it would be.

“ VVe have Dispensatories or Shops of Medicines, wherein you may
 “ easily think, if we have such variety of Plants and Living Creatures, more
 “ then you have in *Europe*, (for we know what you have) the Simples, Drugs,
 “ and Ingredients of Medicines, must likewise be in so much the greater
 “ variety. VVe have them likewise of divers Ages, and long Fermenta-
 “ tions. And for their Preparations, we have not onely all manner of ex-
 “ quisit Distillations and Separations, and especially by gentle Heats, and
 “ Percolations through divers Strainers, yea, and Substances; but also exact
 “ Forms of Composition, whereby they incorporate almost as they were
 “ Natural Simples.

“ VVe have also divers Mechanical Arts, which you have not, and
 “ Stuffs made by them; as Papers, Linnen, Silks, Tissues, dainty works of
 “ Feathers of wonderful lustre, excellent Dies, and many others; and Shops
 “ likewise as well for such as are not brought into vulgar use amongst us,
 “ as for those that are. For you must know, that of the things before re-
 “ cited, many are grown into use throughout the Kingdom; but yet, if
 “ they did flow from our Invention, we have of them also for Patterns and
 “ Principals.

“ VVe have also Furnaces of great diversities, and that keep great di-
 versity of heats, fierce and quick strong and constant, soft and milde,
 “ blown, quiet, dry, moist, and the like. But above all we have heats, in
 “ imitation of the Suns and Heavenly Bodies heats, that pass divers Inequa-
 “ lities, and (as it were) Orbs, Progresses and Returns, whereby we may
 “ produce admirable effects. Besides, we have heats of Dung, and of Bel-
 “ lies and Maws of Living Creatures, and of their Bloods and Bodies; and
 “ of Hays and Herbs laid up moist; of Lime unquenched, and such like.
 “ Instruments also which generate heat onely by motion; and further, places
 “ for strong Insolations; and again, places under the Earth, which by Na-
 “ ture or Art yield Heat. These divers heats we use, as the nature of the ope-
 “ ration which we intend, requireth.

“ VVe have also Perspective Houses where we make Demonstration
 “ of all Lights and Radiations, and of all Colours; and out of things un-
 “ coloured and transparent, we can represent unto you all severall colours,
 “ not in Rainbows (as it is in Gems and Prisms) but of themselves single.
 “ VVe represent also all Multiplications of Light, which we carry to great
 “ distance, and make so sharp as to discern small Points and Lines; also all
 “ colourations of Light, all delusions and deceits of the Sight, in Figures,
 “ Magnitudes, Motions, Colours; all demonstrations of Shadows. VVe
 “ finde also divers means yet unknown to you of producing of Light origi-
 “ nally from divers Bodies. VVe procure means of seeing objects afar off,
 “ as in the Heaven, and remote places; and represent things near as afar off,
 “ and things afar off as near, making feigned distances. VVe have also helps
 “ for the Sight, far above Spectacles and Glasses in use. VVe have also
 “ Glasses and Means to see small and minute Bodies perfectly and distinctly,
 “ as the shapes and colours of small Flies and VVorms, grains and flaws in
 “ Gems, which cannot otherwise be seen, observations in Urine and Blood,
 “ not otherwise to be seen. VVe make Artificial Rainbows, Halo's, and
 “ Circles about Light. VVe represent also all manner of Reflexions, Re-
 “ fractions, and Multiplication of Visual Beams of Objects.

“ VVe have also Precious Stones of all kindes, many of them of great
 “ beauty, and to you unknown; Crystals likewise, and Glasses of divers
 “ kindes, and amongst them some of Metals vitrificated, and other Materi-
 “ als, beside those of which you make Glas: Also a number of Fossiles
 “ and imperfect Minerals, which you have not; likewise Loadstones of pro-
 “ digious virtue, and other rare Stones, both Natural and Artificial.

“ VVe have also Sound-houses, where we practise and demonstrate all
 “ Sounds and their Generation. We have Harmonies which you have not,
 “ of Quarter-sounds, and lesser Slides of Sounds; divers Instruments of
 “ Musick likewise to you unknown, some sweeter then any you have, with
 “ Bells and Rings that are dainty and sweet. We represent small Sounds as
 “ great and deep, likewise great Sounds extenuate and sharp. We make
 “ divers tremblings and warblings of Sounds, which in their original are
 “ entire. We represent and imitate all articulate Sounds and Letters, and
 “ the Voices and Notes of Beasts and Birds. VVe have certain helps, which
 “ set to the Ear, do further the hearing greatly. We have also divers strange
 “ and artificial Echo's reflecting the voice many times, and as it were to sing
 “ it; and some that give back the voice louder then it came, some shriller,
 “ and some deeper, yea, some rendring the voice differing in the Letters or
 “ articulate Sound from that they receive. We have all means to convey
 “ Sounds in Trunks and Pipes in strange lines and distances.

“ We

“ We have also Perfume-houses, wherewith we joyn also practices of
 “ Taste ; we multiply Smells, which may seem strange ; we imitate Smells,
 “ making all Smells to breath out of other mixtures then those that give them.
 “ We make divers imitations of Taste likewise, so that they will deceive any
 “ Mans taste. And in this House we contain also a Confiture-house, where
 “ we make all Sweet-meats, dry and moist, and divers pleasant Wines, Milks,
 “ Broths, and Sallets, far in greater variety then you have.

“ We have also Engine-houses, where are prepared Engines and Instru-
 “ ments for all sorts of motions. There we imitate and practise to make
 “ swifter motions then any you have, either out of your Muskets or any En-
 “ gine that you have; and to make them, and multiply them more easily, and
 “ with small force, by wheels and other means; and to make them stronger
 “ and more violent then yours are, exceeding your greatest Cannors and
 “ Basilisks. We represent also Ordnance and Instruments of War, and En-
 “ gines of all kindes; and likewise new mixtures and compositions of Gun-
 “ powder, Wildefires burning in Water and unquenchable; also Fireworks
 “ of all variety, both for pleasure and use. We imitate also flights of Birds ;
 “ we have some degrees of flying in the Air ; we have Ships and Boats for
 “ going under Water, and brooking of Seas ; also Swimming-girdles and
 “ Supporters. We have divers curious Clocks, and other like motions of
 “ Return, and some perpetual motions. We imitate also motions of Living
 “ Creatures by Images of Men, Beasts, Birds, Fishes, and Serpents ; we have
 “ also a great number of other various motions, strange for quality, fineness
 “ and subtilty.

“ We have also a Mathematical-house, where are represented all Instru-
 “ ments, as well of Geometry as Astronomy, exquisitely made.

“ We have also Houses of Deceits of the Senses, where we represent
 “ all manner of feats of Jugling, false Apparitions, Impostures and Illusions,
 “ and their Fallacies. And surely, you will easily believe that we that have so
 “ many things truly Natural, which induce admiration, could in a world of
 “ particulars deceive the Senses, if we would disguise those things, and labor
 “ to make them more miraculous : But we do hate all Impostures and Lies
 “ infomuch, as we have severely forbidden it to all our Fellows, under pain
 “ of Ignominy and Fines, that they do not shew any natural work or thing,
 “ adorned or swelling, but onely pure as it is, and without all affectation of
 “ strangeness.

“ These are (my Son) the riches of *Solomons House*.

“ For the severall employments and offices of our Fellows ; we have
 “ twelve that sail into Foreign Countreys under the names of other Nations,
 “ (for our own we conceal) who bring us the Books, and Abstracts, and Pat-
 “ terns of Experiments of all other Parts. These we call *Merchants of*
 “ *Light*.

“ We have three that collect the Experiments, which are in all Books.
 “ These we call *Depredators*.

“ We have three that collect the Experiments of all Mechanical Arts,
 “ and also of Liberal Sciences, and also of Practices which are not brought
 “ into Arts. These we call *Mystery-men*.

“ We have three that try new Experiments, such as themselves think
 “ good. These we call *Pioneers or Miners*.

“ We have three that draw the Experiments of the former four into
 “ Titles and Tables, to give the better light for the drawing of Observations
 “ and Axioms out of them. These we call *Compilers*.

“ We have three that bend themselves, looking into the Experiments
 “ of their Fellows, and cast about how to draw out of them things of use
 “ and practice for Mans life and knowledge, as well for Works, as for plain
 “ demonstration of Causes; means of Natural Divinations, and the easie
 “ and clear discovery of the Virtues and Parts of Bodies. These we call
 “ Dowry-men or Benefactors.

“ Then after divers Meetings and Consults of our whole number, to
 “ consider of the former Labors and Collections, we have three that take
 “ care out of them to direct new Experiments of a higher Light, more pene-
 “ trating into Nature then the former. These we call Lamps.

“ VVe have three others that do execute the Experiment so directed,
 “ and report them. These we call Inoculators.

“ Lastly, VVe have three that raise the former Discoveries by Experi-
 “ ments into greater Observations, Axioms, and Aphorisms. These we call
 “ Interpreters of Nature.

“ VVe have also; as you must think, Novices and Apprentices, that
 “ the succession of the former employed Men do not fail; besides a great
 “ number of Servants and Attendants, Men and VVomen. And this we do
 “ also, VVe have Consultations which of the Inventions and Experiences,
 “ which we have discovered shall be published, and which not; and take all
 “ an Oath of Secrecy for the concealing of those which we think meet to keep
 “ secret; though some of those we do reveal sometime to the State, and
 “ some not.

“ For our Ordinances and Rites; we have two very long and fair Gal-
 “ leries. In one of these we place Patterns and Samples of all manner of the
 “ more rare and excellent Inventions; in the other we place the Statues of
 “ all principal Inventors. There we have the Statue of your *Columbus*, that
 “ discovered the *West-Indies*, also the Inventor of Ships; your Monk that
 “ was the Inventor of Ordnance, and of Gun-powder; the Inventor of
 “ Musick; the Inventor of Letters; the Inventor of Printing; the Inventor
 “ of Observations of Astronomy; the Inventor of Works in Metal; the
 “ Inventor of Glass; the Inventor of Silk of the Worm; the Inventor of
 “ Wine; the Inventor of Corn and Bread; the Inventor of Sugars: And
 “ all these by more certain Tradition, then you have. Then we have divers
 “ Inventors of our own of excellent Works, which since you have not seen,
 “ it were too long to make Descriptions of them; and besides, in the right
 “ understanding of those Descriptions, you might easily err. For upon every
 “ Invention of value we erect a Statue to the Inventor, and give him a libe-
 “ ral and honorable reward. These Statues are some of Brasse, some of Marble
 “ and Touch-stone, some of Cedar, and other special Woods gilt and adorn-
 “ ed, some of Iron, some of Silver, some of Gold.

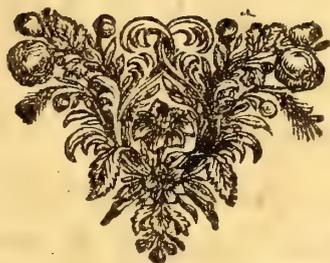

“ We have certain Hymns and Services which we say daily, of *Laud* and
 “ and *Thanks* to God for his marvellous Works; and Forms of Prayers, im-
 “ ploring his aid and blessing for the Illumination of our Labors, and the
 “ turning them into good and holy uses.

“ Lastly, We have Circuits or Visits of divers principal Cities of the
 “ Kingdom, where, as it cometh to pass, we do publish such new profitable
 “ Inventions, as we think good. And we do also declare Natural Divinati-
 “ ons of Diseases, Plagues, Swarms of hurtful Creatures, Scarcity, Tempest,
 “ Earth quakes, great Inundations, Comets, Temperature of the Year, and
 “ divers other things; and we give counsel thereupon, what the People shall
 “ do for the prevention and remedy of them.

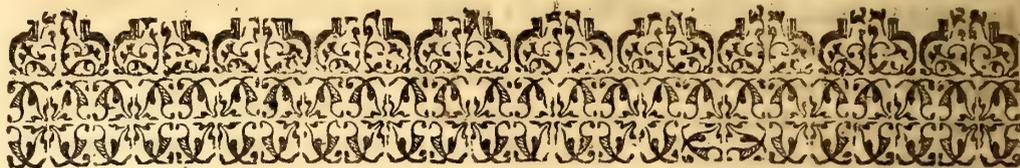

“ And

And when he had said this, he stood up: And I, as I had been taught, kneeled down, and he laid his right hand upon my head, and said, *God bless thee, my Son, and God bless this Relation which I have made: I give thee leave to publish it for the good of other Nations, for we here are in Gods Bosome, a Land unknown.* And so he left me, having assigned a value of about Two thousand Ducats for a Bounty to me, and my Fellows; for they give great largesses where they come upon all occasions.

The rest was not perfected.

Magnalia

Magnalia Naturæ præcipue quoad
usus Humanos.

The { Prolongation of Life.
Restitution of Youth in some degree.
Retardation of Age.
Curing of Diseases, counted Incurable.
Mitigation of Pain.

More easie and less loathsome Purgings.

The { increasing of Strength and Activity.
increasing of Ability, to suffer Torture or Pain.
altering of Complexions, and Fatness, and Leanness.
altering of Statures.
altering of Features.
increasing and exalting of the Intellectual Parts.

Version of Bodies into other Bodies.

Making of new Species.

Transplanting of one Species into another.

Instruments of Destruction, as of War and Poyson.

Exhilaration of the Spirits, and putting them in good disposition.

Force of the Imagination, either upon another Body, or upon the Body it self.

Acceleration of { Time in Maturations.

Putrefaction.
Decoction.
Germination.

Making rich Composts for the Earth.

Impressions of the Air, and raising of Tempests.

Great alteration, as in Induration, Emollition, &c.

Turning Crude and Watry Substances into Oily and Unctuous Substances.

Drawing of new Foods out of Substances not now in use.

Making new Threds for Apparel, and new Stuffs, such as are Paper, Glass, &c.

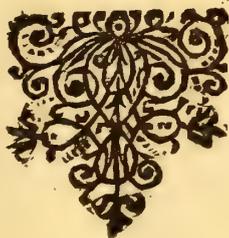

Natural Divinations.

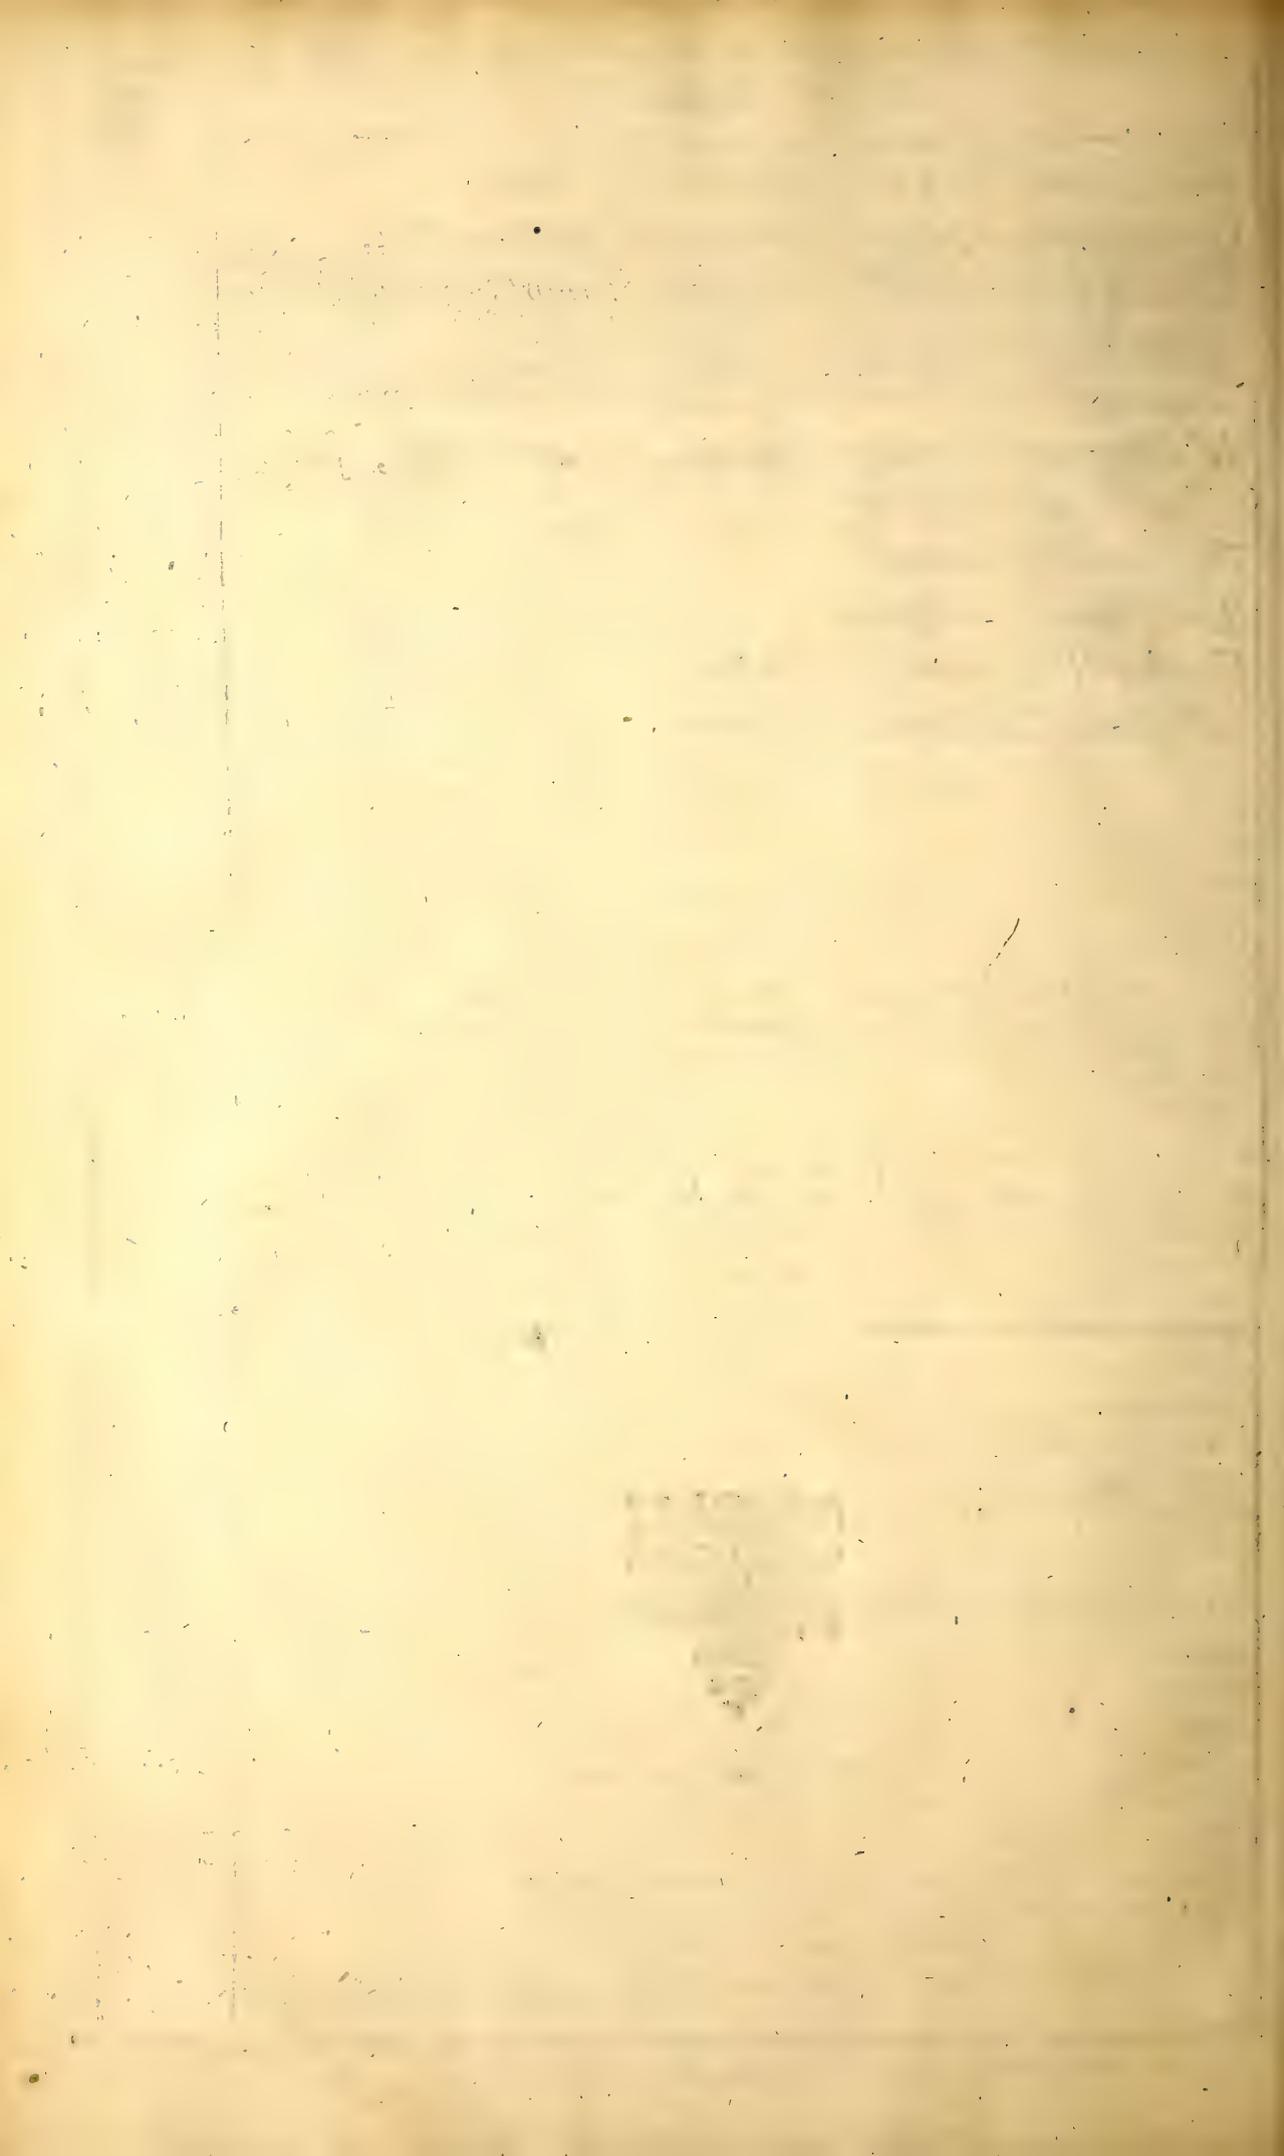

Deceptions of the Senses.

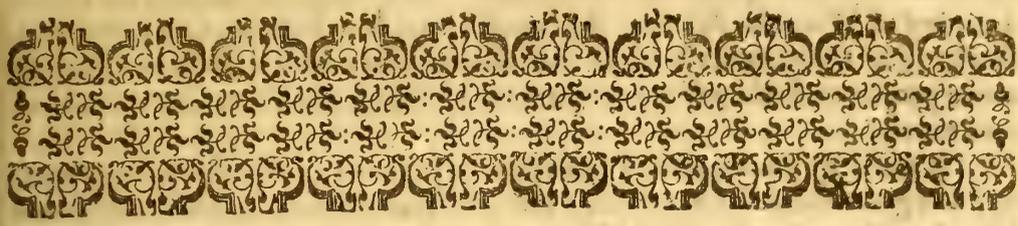

Greater Pleasures of the Senses.

Artificial Minerals and Cements.

FINIS.

NATURAL HISTORY.

Century I.

Dig a Pit upon the Sea-shore, somewhat above the High-water Mark, and sink it as deep as the Low-water Mark; And as the Tide comieth in, it will fill with Water, Fresh and Potable. This is commonly practised upon the Coast of *Barbary*, where other Fresh Water is wanting. And *Cesar* knew this well, when he was besieged in *Alexandria*; for by digging of Pits in the Sea-shore, he did frustrate the laborious Works of the Enemies, which had turned the Sea-water upon the Wells of *Alexandria*, and so saved his Army, being then in Desperation. But *Cesar* mistook the cause; for he thought that all Sea-lands had Natural Springs of Fresh-water. But it is plain, that it is the Sea-water, because the Pit filleth according to the Measure of the Tide: And the Sea-water passing or straining through the Sands, leaveth the Saltness.

I remember to have read, that Tryal hath been made of Salt-water passed through Earth; through ten Vessels, one within another, and yet it hath not lost his Saltness, as to become potable: But the same Man saith, that (by the relation of another) Salt-water drained through twenty Vessels, hath become fresh. This Experiment seemeth to cross that other of Pits, made by the Sea-side; and yet but in part, if it be true, that twenty Repetitions do the effect. But it is worth the note, how poor the Imitations of Nature are, in common course of Experiments, except they be led by great Judgment, and some good Light of *Axioms*. For first, there is no small difference between a Passage of Water through twenty small Vessels, and through such a distance, as between the Low-water and High-water Mark. Secondly, there is a great difference between Earth and Sand; for all Earth hath in it a kinde of Nitrous Salt, from which, Sand is more free: And besides, Earth doth not strain the Water so finely as Sand doth. But there is a third point, that I suspect as much, or more than the other two; and that is, that in the Experiment of *Transmission* of the Sea-water into the Pits, the Water riseth; but in the Experiment of *Transmission* of the Water, through the Vessels, it falleth: Now certain it is, that the Salter part of Water (once

B salted

I.
Experiments in Consort, touching the Straining and Passing of Bodies one thorow another; which they call Percolation.

2.

salted throughout) goeth to the bottom. And therefore no marvel if the draining of Water by descent, doth make it fresh: Besides; I do somewhat doubt, that the very dashing of the Water that cometh from the Sea, is more proper to strike off the salt part, than where the Water slideth of her own motion.

3. It seemeth *Percolation* or *Transmission* (which is commonly called *Straining*) is a good kinde of *Separation*, not onely of thick from thin, and gross from fine, but of more subtile Natures; and varieth according to the Body, through which the *Transmission* is made. As if through a Woollen-bag, the liquor leaveth the fatness; if through Sand, the saltness, &c. They speak of severing Wine from Water, passing it through Ivy-wood, or through other the like porous body, but *Non constat*.

4. The Gum of Trees (which we see to be commonly shining and clear) is but a fine passage, or straining of the Juice of the Tree, through the Wood and Bark. And in like manner, *Cornish Diamonds*, and *Rock Rubies*, (which are yet more resplendent than Gums) are the fine Exudations of Stone.

5. *Aristotle* giveth the cause vainly, Why the *Feathers* of Birds are of more lively colours than the Hairs of Beasts; for no Beast hath any fine Azure, or Carnation, or Green Hair. He saith it is, because Birds are more in the Beams of the Sun than Beasts, but that is manifestly untrue; for Cattle are more in the Sun than Birds, that live commonly in the Woods, or in some Covert. The true cause is, that the excrementitious moisture of living Creatures, which maketh as well the Feathers in Birds as the Hair in Beasts, passeth in Birds through a finer and more delicate Strainer, than it doth in Beasts: For Feathers pass through Quills, and Hair through Skin.

6. The *Clarifying* of *Liquors* by Adhesion, is an inward *Percolation*, and is effected, when some cleaving Body is mixed and agitated with the *Liquors*; whereby the grosser part of the Liquor sticks to that cleaving Body; and so the finer parts are freed from the grosser. So the *Apothecaries* clarify their Syrups by Whites of Eggs, beaten with the Juices which they would clarify; which whites of Eggs, gather all the dregs and grosser parts of the Juice to them; and after the Syrup being set on the fire, the whites of Eggs themselves harden, and are taken forth. So *Ippocras* is clarified by mixing with Milk, and stirring it about, and then passing it through a Woollen-bag, which they call *Hippocrates Sleeve*; and the cleaving Nature of the Milk, draweth the Powder of the Spices, and grosser parts of the Liquor to it, and in the passage they stick upon the Woollen-bag.

7. The clarifying of Water, is an experiment tending to Health, besides the pleasure of the Eye, when Water is Crystalline. It is effected by casting in, and placing Pebbles at the head of a Current, that the Water may strain through them.

8. It may be *Percolation* doth not onely cause clearness and splendor, but sweetness of savor; for that also followeth, as well as clearness, when the finer parts are severed from the grosser. So it is found, that the sweats of men that have much heat, and exercise much, and have clean Bodies and fine Skins, do smell sweet, as was said of *Alexander*; and we see commonly, that Gums have sweet odors.

9.

Experiments
in Confort,
touching
Motion of
Bodies upon
their Pressure.

TAKE a Glass, and put Water into it, and wet your finger, and draw it round about the lip of the Glass, pressing it somewhat hard; and after you have drawn it some few times about, it will make the Water frisk and

and sprinkle up in a fine Dew: This instance doth excellently demonstrate the force of *Compression* in a solid Body. For whensoever a solid Body (as Wood, Stone, Metal, &c.) is pressed, there is an inward tumult in the parts thereof, seeking to deliver themselves from the *Compression*: And this is the cause of all *Violent Motion*. Wherein it is strange in the highest degree; that this Motion hath never been observed, nor enquired; it being of all Motions, the most common, and the chief root of all *Mechanical Operations*. This Motion worketh in round at first, by way of Proof and Search, which way to deliver it self, and then worketh in Progress, where it findeth the deliverance easiest. In *Liquors* this Motion is visible; for all Liquors struck on, make round circles, and withal dash, but in *Solids* (which break not) it is so subtile, as it is invisible; but nevertheless bewrayeth it self by many effects, as in this instance whereof we speak. For the *Pressure* of the Finger furthered by the wetting (because it sticketh so much the better unto the Lip of the Glass) after some continuance, putteth all the small parts of the Glass into work, that they strike the Water sharply; from which *Percussion*, that sprinkling cometh.

If you strike or pierce a *Solid Body* that is brittle, as Glass or Sugar; it breaketh not onely where the immediate force is, but breaketh all about into shivers and fitters; the Motion upon the *Pressure* searching all ways, and breaking where it findeth the Body weakest.

The Powder in Shot being dilated into such a Flame, as endureth not *Compression*, moveth likewise in round (the Flame being in the nature of a *Liquid Body*) sometimes recoyling, sometimes breaking the Peece; but generally discharging the Bullet, because there it findeth easiest deliverance.

This Motion upon *Pressure*, and the Reciprocal thereof, which is Motion upon *Tensure*; we use to call (by one common name) *Motion of Liberty*; which is, when any Body being forced to a *Preternatural* Extent or Dimension, delivereth and restoreth it self to the natural: As when a blown Bladder (pressed) riseth again; or when *Leather* or *Cloth* tentured, spring back. These two Motions (of which there be infinite instances) we shall handle in due place.

This Motion upon *Pressure* is excellently also demonstrated in *Sounds*: As when one chimeth upon a Bell, it soundeth; but as soon as he layeth his hand upon it, the *Sound* ceaseth: And so, the sound of a *Virginal String*, as soon as the Quill of the Jack falleth from it, stoppeth. For these sounds are produced by the subtile *Percussion* of the Minute parts of the Bell or String upon the Air; All one, as the *Water* is caused to leap by the subtile *Percussion* of the Minute parts of the Glass upon the *Water*, whereof we spake a little before in the *Ninth Experiment*. For you must not take it to be the local shaking of the Bell or String that doth it. As we shall fully declare when we come hereafter to handle *Sounds*.

TAKE a Glass with a *Belly*, and a long *Neb*, fill the *Belly* (in part) with *Water*: Take also another Glass, whereinto put *Claret Wine* and *Water* mingled. Reverse the first Glass, with the *Belly* upwards, stopping the *Neb* with your Finger; then dip the mouth of it within the second Glass, and remove your Finger. Continue it in that posture for a time, and it will unmingle the *Wine* from the *Water*; the *Wine* ascending and settling in the top of the upper Glass, and the *Water* descending and settling in the bottom of the lower Glass. The passage is apparent to the Eye; for

10.

11.

12.

13.

14.
Experiments
in Consort,
touching Se-
parations of
Bodies by
weights.

you shall see the Wine, as it were, in a small vein, rising through the Water, For handfomness sake (because the working requireth some small time) it were good you hang the upper *Glass* upon a Nail. But as soon as there is gathered so much pure and unmixed Water in the bottom of the lower *Glass*, as that the Mouth of the upper *Glass* dippeth into it, the Motion ceaseth.

15. Let the upper *Glass* be Wine, and the lower Water; there followeth no Motion at all. Let the upper *Glass* be Water pure, the lower Water coloured, or contrariwise there followeth no Motion at all. But it hath been tryed, that though the mixture of Wine and Water, in the lower *Glass*, be three parts Water, and but one Wine; yet it doth not dead the Motion. This separation of Water and Wine appeareth to be made by weight; for it must be of *Bodies* of unequal weight, or else it worketh not; and the heavier *Body* must ever be in the upper *Glass*. But then note withal, that the water being made pensible, and there being a great weight of Water in the Belly of the *Glass*, sustained by a small Pillar of Water in the neck of the *Glass*; it is that which setteth the Motion on work: For Water and Wine in one *Glass*, with long standing, will hardly sever.

16. This *Experiment* would be extended from mixtures of several *Liquors* to *Simple Bodies*, which consist of several familiar parts: Try it therefore with *Broyn* or *Salt-water* and *Fresh-water*, placing the *Salt-water* (which is the heavier) in the upper *Glass*, and see whether the fresh will come above. Try it also with Water thick Sugred, and pure Water; and see whether the Water which cometh above, will lose his sweetness: For which purpose, it were good there were a little Cock made in the Belly of the upper *Glass*.

17. Experiments in Confort, touching *Judicious* and *Accurate Infusions*, both in *Liquors*, and *Air*.

17. **I**N *Bodies* containing *fine Spirits*, which do easily dissipate when you make *Infusions*; the Rule is, A short stay of the *Body* in the *Liquor* receiveth the Spirit, and a longer stay confoundeth it; because it draweth forth the Earthy part withal, which embaseth the finer. And therefore it is an Error in *Physicians*, to rest simply upon the length of stay for encreasing the vertue. But if you will have the *Infusion* strong, in those kinde of *Bodies*, which have *fine Spirits*, your way is not to give longer time, but to repeat the *Infusion* of the *Body* oftner. Take *Violets*, and infuse a good Pugil of them in a Quart of Vinegar, let them stay three quarters of an hour, and take them forth, and refresh the *Infusion* with like quantity of new *Violets* seven times, and it will make a *Vinegar* so fresh of the *Flower*, as if a Twelve-moneth after it be brought you in a Saucer, you shall smell it before it come at you. Note, that it smelleth more perfectly of the *Flower* a good while after, then at first.

18. This Rule which we have given, is of singular use for the preparations of *Medicines*, and other *Infusions*. As for example, the Leaf of *Burrage* hath an excellent Spirit, to repress the fuliginous vapor of Dusky Melancholy, and so to cure Madnes: But nevertheless, if the Leaf be infused long, it yeildeth forth but a raw substance of no vertue: Therefore I suppose, that if in the Must of Wine or Wort of Beer, while it worketh before it be Tunned, the *Burrage* stay a small time, and be often changed with fresh, it vwill make a soveraign Drink for *Melancholy Passions*. And the like I conceive of *Orange Flowers*.

19. *Rubarb* hath manifestly in it Parts of contrary Operations: Parts that purge, and parts that binde the *Body*; and the first lay looser, and the latter lay deeper:

deeper ; So that if you infuse *Rubarb* for an hour, and crush it well, it will purge better, and binde the Body less after the purging, than if it stood Twenty four hours : This is tried, but I conceive likewise, that by repeating the Infusion of *Rubarb*, several times (as was said of *Violets*) letting each stay in but a small time, you may make it as strong a Purging Medicine, as *Scammony*. And it is not a small thing won in *Physick*, if you can make *Rubarb*, and other Medicines that are *Benedict*, as strong Purgers, as those that are not without some malignity.

Purging Medicines, for the most part, have their *Purgative Vertue* in a fine Spirit, as appeareth by that they indure not boiling, without much loss of vertue. And therefore it is of good use in *Physick*, if you can retain the Purging of Vertue, and take away the unpleasant taste of the Purger ; which it is like you may do, by this course of infusing oft with little stay. For it is probable, that the horrible and odious taste is in the grosser part.

Generally, the working by *Infusions* is gross and blind, except you first try the issuing of the several parts of the Body, which of them issue more speedily, and which more slowly ; and so by apportioning the time, can take and leave that quality which you desire. This to know, there be two ways ; the one to try what long stay, and what short stay worketh, as hath been said ; the other to try, in order, the succeeding *Infusions*, of one and the same Body, successively, in several Liquors. As for example, Take *Orange-Pills*, or *Rosemary*, or *Cinnamon*, or what you will ; and let them infuse half an hour in Water ; then take them out, and infuse them again in other Water ; and so the third time ; and then taste and consider the first Water, the second, and the third, and you will finde them differing, not onely in strength and weakness, but otherwise in taste, or odor ; for it may be the first Water will have more of the sent, as more fragrant ; and the second more of the taste, as more bitter or biting, &c.

Infusions in Air (for so we may call *Odors*) have the same diversities with *Infusions in Water* ; in that the several *Odors* (which are in one Flower, or other Body) issue at several times, some earlier, some later : So we finde, that *Violets*, *Woodbines*, *Strawberries*, yield a pleasing sent, that cometh forth first ; but soon after an ill sent quite differing from the former. Which is caused not so much by mellowing, as by the late issuing of the grosser Spirit.

As we may desire to extract the finest Spirits in some cases ; so we may desire also to discharge them (as hurtful) in some other. So Wine burnt, by reason of the evaporating of the finer Spirit, inflameth less, and is best in Agues : *Opium* leeseeth some of his poisonous quality, if it be vapored out, mingled with Spirit of Wine, or the like : *Sean* leeseeth somewhat of his windiness by decocting ; and (generally) subtiler or windy Spirits are taken off by Incension, or Evaporation. And even in *Infusions* in things that are of too high a spirit, you were better pour off the first Infusion, after a small time, and use the latter.

Bubbles are in the form of an Hemisphere ; *Air* within, and a little Skin of Water without : And it seemeth somewhat strange, that the *Air* should rise so swiftly, while it is in the Water ; and when it cometh to the top, should be staid by so weak a cover, as that of the Bubble is. But as for the swift ascent of the *Air*, while it is under the Water, that is a motion of Percussion from the Water, which it self descending, driveth up the *Air* ; and no motion of *Levity* in the *Air*. And this *Democritus*

20.

21.

22.

23.

24.

Experiment Solitary, touching the Appetite of Continuation in Liquids.

called *Motus Plaga*. In this common *Experiment*, the cause of the enclosure of the *Bubble* is for that the Appetite to resist Separation, or Discontinuance (which in solid *Bodies* is strong) is also in *Liquors*, though fainter and weaker: As we see in this of the *Bubble*; we see it also in little Glasses of Spittle that Children make of Rushes; and in Castles of Bubbles, which they make by blowing into *Water*, having obtained a little degree of Tenacity by Mixture of Soap: We see it also in the *Stillicides* of *Water*, which, if there be *Water* enough to follow, will draw themselves into a small Thred, because they will discontinue; but if there be no remedy, then they cast themselves into round Drops; which is the Figure, that saveth the Body most from Discontinuance: The same reason is of the Roundness of the *Bubble*, as well for the Skin of *Water*, as for the *Air* within: For the *Air* likewise avoideth *Discontinuance*; and therefore casteth it self into a round Figure. And for the stop and arrest of the *Air* a little while, it sheweth, that the *Air* of it self hath little, or no Appetite of Ascending.

25.
Experiment
Solitary,
touching the
making of
Artificial
Springs.

THE Rejection, which I continually use, of *Experiments* (though it appeareth not) is infinite; but yet if an *Experiment* be probable in the Work, and of great use, I receive it, but deliver it as doubtful. It was reported by a sober man, that an *Artificial Spring* may be made thus: Find out a hanging Ground, where there is a good quick Fall of Rain-water. Lay a Half-Trough of Stone, of a good length, three or four foot deep within the same Ground; with one end upon the high Ground, the other upon the low. Cover the Trough with Brakes a good thickness, and cast Sand upon the top of the Brakes: You shall see (saith he) that after some showres are past, the lower end of the Trough will be like a *Spring* of *Water*; which is no marvel, if it hold, while the Rain-water lasteth; but he said it would continue long time after the Rain is past: As if the *Water* did multiply it self upon the *Air*, by the help of the Coldness and Condensation of the Earth, and the Consort of the first *Water*.

26.
Experiment
Solitary,
touching the
Venomous
quality of
Mans Flesh.

THE *French* (which put off the name of the *French Disease*, unto the name of the *Disease of Naples*) do report, That at the siege of *Naples*, there were certain wicked Merchants that barrelled up *Mans Flesh* (of some that had been lately slain in *Barbary*) and sold it for *Tunney*; and that, upon that foul and high Nourishment, was the Original of that *Disease*. Which may well be; For that it is certain, that the *Cambals*, in the *West-Indies*, eat *Mans Flesh*; and the *West-Indies* were full of the Pox when they were first discovered: And at this day the *Mortalest* *poysons*, practised by the *West-Indians*, have some mixture of the Blood, or Fat, or *Flesh* of *Man*. And divers *Witches*, and *Sorcereesses*, as well amongst the *Heathen*, as amongst the *Christians*, have fed upon *Mans flesh*, to aid (as it seemeth) their *Imagination*, with high and foul *Vapors*.

27.
Experiment
Solitary,
touching the
Version and
Transmutation
of *Air* into
Water.

IT seemeth that there be these ways (in likelihood) of *Version* of *Vapors* for *Air*, into *Water* and *Moisture*. The first is *Cold*, which doth manifestly *Condense*; as we see in the contracting of the *Air* in the *Weather-Glass*; whereby it is a degree nearer to *Water*. We see it also in the *Generation* of *Springs*, which the *Ancients* thought (very probably) to be made by the *Version* of *Air* into *Water*, holpen by the *Rest*, which the *Air* hath in those parts, whereby it cannot dissipate. And by the coldness of *Rocks*; for there

there *Springs* are chiefly generated. We see it also in the Effects of the *Cold* of the *Middle Region* (as they call it) of the *Air*; which produceth *Dews* and *Rains*. And the Experiment of turning *Water* into *Ice*, by *Snow*, *Nitre*, and *Salt* (whereof we shall speak hereafter) would be transferred to the turning of *Air* into *Water*. The second way is by *Compression*; as in *Stillatories*, where the *Vapor* is turned back, upon it self, by the Encounter of the *Sides* of the *Stillatory*; and in the *Dew* upon the *Covers* of *Boiling Pots*; and in the *Dew* towards *Rain*, upon *Marble*, and *VVainscot*. But this is like to do no great effect; except it be upon *Vapors*, and gross *Air*, that are already very near in *Degree* to *Water*. The third is that, which may be searched into, but doth not yet appear; which is, by *Mingling* of moist *Vapors* with *Air*; and trying if they will not bring a *Return* of more *Water*, than the *Water* was at first: For if so, That *Increase* is a *Version* of the *Air*: Therefore put *VVater* into the bottom of a *Stillatory*, with the *Neb* stopped; weigh the *VVater* first; hang in the *Middle* of the *Stillatory* a large *Sponge*; and see what quantity of *VVater* you can crush out of it; and what it is, more, or less, compared with the *VVater* spent; for you must understand, that if any *Version* can be wrought, it will be easily done in small *Pores*: And that is the reason why we prescribe a *Sponge*. The fourth way is probable also, though not appearing; which is, by receiving the *Air* into the small *Pores* of *Bodies*; For (as hath been said) every thing in small quantity is more easie for *Version*; and *Tangible Bodies* have no pleasure in the consort of *Air*, but endeavor to subact it into a more *Dense Body*: But in *Entire Bodies* it is checked; because, if the *Air* should *Condense*, there is nothing to succeed: Therefore it must be in loose *Bodies*, as *Sand*, and *Powder*, which we see, if they lie close, of themselves gather *Moisture*.

IT is reported by some of the *Ancients*, That *Whelps*, or other *Creatures*, if they be put young into such a *Cage*, or *Box*, as they cannot rise to their *Stature*, but may increase in breadth or length, will grow accordingly, as they can get room; which, if it be true, and feasible, and that the young *Creature* lo pressed, and streightned, doth not thereupon die; it is a means to produce *Dwarf Creatures*, and in a very strange *Figure*. This is certain, and noted long since, That the *Pressure*, or *Forming* of *Parts* of *Creatures*, when they are very young, doth alter the shape not a little: As the stroaking of the *Heads* of *Infants*, between the *Hands*, was noted of old, to make *Macrocephali*; which shape of the *Head*, at that time, was esteemed. And the raising gently of the *Bridge* of the *Nose*, doth prevent the *Deformity* of a *Saddle Nose*. Which observation well weighed, may teach a means, to make the *Persons* of *Men* and *Women*, in many kinds, more comely and better featured, than otherwise they would be; by the *Forming* and *Shaping* of them in their *Infancy*: As by *Stroaking* up the *Calves* of the *Legs*, to keep them from falling down too low; and by *Stroaking* up the *Forehead*, to keep them from being low *Foreheaded*. And it is a common practice to swathe *Infants*, that they may grow more straight, and better shaped; and we see young *Women*, by wearing straight *Bodies*, keep themselves from being *Gross* and *Corpulent*.

O *Nions*, as they hang, will many of them shoot forth; and so will *Pennyroyal*; and so will an *Herb* called *Orpin*; with which they use, in the *Country*, to trim their *Houses*, binding it to a *Lath*, or *Stick*, and setting it against a *Wall*. *VVe* see it likewise, more especially, in the greater

ments.

Semper-vive, which will put out Branches, two or three years : But it is true, that commonly they wrap the Root in a cloth besmeared with Oyl ; and renew it once in a half year. The like is reported by some of the Ancients of the stalks of *Lillies*. The cause is, for that these *Plants* have a strong dense, and succulent moisture, which is not apt to exhale ; and so is able, from the old store, without drawing help from the Earth, to suffice the sprouting of the *Plant* : And this sprouting is chiefly in the late Spring, or early Summer ; which are the times of putting forth. We see also, that stumps of *Trees*, lying out of the Ground, will put forth Sprouts for a time. But it is a noble tryal, and of very great consequence, to try whether these things, in the sprouting, do encrease weight ; which must be tryed, by weighing them before they be hanged up ; and afterwards again, when they are sprouted. For if they increase not in weight, then it is no more but this, That what they send forth in the sprout, they leese in some other part ; but if they gather weight, then it is *Magnale Natura* : For it sheweth, that *Air* may be made so to be condensed, as to be converted into a dense Body ; whereas the race and period of all things, here above the Earth, is to extenuate and turn things to be more pneumatical, and rare ; and not to be retrograde, from pneumatical to that which is dense. It sheweth also, that *Air* can nourish ; which is another great matter of consequence. Note, that to try this, the Experiment of the *Semper-vive*, must be made without oyling the cloth ; for else, it may be, the Plant receiveth nourishment from the Oyl.

30.
Experiment
Solitary,
touching the
Commixture of
Flame and
Air, and the
great force
thereof.

Flame and *Air* do not mingle, except it be in an instant ; or in the *Vital* *Spirits* of vegetables, and living Creatures. In *Gunpowder*, the force of it hath been ascribed to rarefaction of the earthly substance into *Flame*. And thus far it is true ; and then (forsooth) it is become another Element ; the form whereof occupieth more place ; and so, of Necessity, followeth a Dilatation : And therefore, lest two Bodies should be in one place, there must needs also follow an Expulsion of the Pellet, or blowing up of the Mine. But these are crude and ignorant speculations : For *Flame*, if there were nothing else, except, it were in a very great quantity, will be suffocate with any hard body, such as a Pellet is, or the Barrel of a Gun ; so as the flame would not expel the hard body, but the hard body would kill the flame, and not suffer it to kindle, or spread. But the cause of this so potent a motion is the *Nitre* (which we call otherwise *Salt-Ieter*) which having in it a notable crude and windy Spirit, first by the heat of the *Fire* suddenly dilateth it self ; (and we know that simple *Air*, being preternaturally attenuated by heat, will make it self room, and break, and blow up that which resisteth it.) And secondly, when the *Nitre* hath dilated it self, it bloweth abroad the flame as an inward Bellows. And therefore we see that *Brimstone*, *Pitch*, *Camphire*, *Wildfire*, and divers other inflammable matters ; though they burn cruelly, and are hard to quench, yet they make no such fiery wind, as *Gunpowder* doth : And on the other side, we see that *Quick-silver* (which is a most crude and watry Body) heated, and pent in, hath the like force with *Gunpowder*. As for living Creatures, it is certain, their *Vital* *Spirits* are a substance compounded of an airy and flamy matter ; and though *Air* and *Flame*, being free, will not well mingle ; yet bound in by a Body that hath some fixing, they will. For that you may best see in those two Bodies (which are their Aliments) *Water* and *Oyl* ; for they likewise will not well mingle of themselves, but in the Bodies of Plants, and

and *Living Creatures*, they will. It is no marvel therefore, that a small *Quantity of Spirits*, in the Cells of the Brain, and Cannals of the Sinews, are able to move a whole *Body* (which is of so great mass) both with so great force, as in Wrestling, Leaping; and with so great swiftness, as in playing Division upon the *Lute*: Such is the force of these two *Natures*, *Air* and *Flame* when they incorporate.

TAKE a small *Wax-Candle*, and put it in a Socket of Brass or Iron, then set it upright in a Porringer full of Spirit of Wine, heated; then set both the Candle, and Spirit of Wine on fire, and you shall see the flame of the Candle open it self, and become four or five times bigger then otherwise it would have been, and appear in figure *Globular*, and not in *Pyramis*. You shall see also, that the inward flame of the Candle keepeth colour, and doth not wax any whit blew towards the colour of the outward flame of the Spirit of Wine. This is a noble instance, wherein two things are most remarkable; the one, that one flame within another quencheth not, but is a fixed *Body*, and continueth as *Air* or *Water* do; and therefore flame would still ascend upwards in one greatness, if it were not quenched on the sides; and the greater the flame is at the bottom, the higher is the rise. The other, that Flame doth not mingle with Flame, as *Air* doth with *Air*, or *Water* with *Water*, but onely remaineth contiguous; as it cometh to pass betwixt *Consisting Bodies*. It appeareth also, that the form of a *Pyramis* in Flame, which we usually see, is meerly by accident, and that the *Air* about, by quenching the sides of the Flame, crusheth it, and extenuateth it into that form; for of it self, it would be round: And therefore *Smoak* is in the figure of a *Pyramis* reversed; for the *Air* quencheth the Flame, and receiveth the *Smoak*. Note also, that the flame of the Candle, within the flame of the Spirit of Wine, is troubled, and doth not onely open and move upwards, but moveth waving, and to and fro: As if Flame of his own Nature (if it were not quenched) would roul and turn as well as move upwards. By all which it should seem, that the *Celestial Bodies* (most of them) are true Fires or Flames, as the *Stoicks* held; more fine (perhaps) and rarified, than our flame is. For they are all *Globular* and *Deternate*, they have *Rotation*, and they have the colour and splendor of Flame: So that Flame above, is durable and consistent, and in his natural place; but with us, it is a stranger, and momentany and impure, like *Vulcan* that halted with his fall.

TAKE an *Arrow*, and hold it in Flame for the space of ten Pulses; and when it cometh forth, you shall finde those parts of the Arrow which were on the outsides of the Flame, more burned, blacked, and turned almost into a *Coal*; whereas that in the midst of the flame, will be as if the fire had scarce touched it. This is an instance of great consequence for the discovery of the nature of Flame, and sheweth manifestly, that Flame burneth more violently towards the sides, then in the midst: And, which is more, that *Heat* or *Fire* is not violent or furious, but where it is checked and pent. And therefore the *Peripateticks* (howsoever their opinion of an *Element of Fire*, above the *Air*, is justly exploded) in that point they acquit themselves well: For being opposed, that if there were a sphere of Fire, that incompassed the Earth so near hand, it were impossible, but all things should be burnt up; they answer, that the pure *Elemental Fire*, in his own place, and not irritate, is but of a moderate heat.

31.

Experiment Solitary, touching the Secret Nature of Flame.

32.

Experiment Solitary, touching the Different force of Flame in the midst, and on the sides.

33.
Experiment
Solitary,
touching the
Decrease of the
Natural Motion
of Gravity
in great
distance from
the Earth; or
within some
depth of the
Earth.

IT is affirmed constantly by many, as an usual Experiment, That a lump of *Iron*, in the bottom of a Mine, will be tumbled and stirred by two Mens strength; which if you bring it to the top of the Earth, will ask six Mens strength at the least to stir it. It is a noble instance, and is fit to be tryed to the full: For it is very probable, that the *Motion of Gravity* worketh weakly, both far from the Earth, and also within the Earth: The former, because the appetite of Union of Dense Bodies with the Earth, in respect of the distance is more dull. The latter, because the Body hath in part attained his nature, when it is some depth in the Earth. For as for the moving to a point or place (which was the opinion of the *Antients*) it is a meer vanity.

34.
Experiment
Solitary,
touching the
Contraction of
bodies in bulk,
by the mixture
of the more
Liquid Body,
with the more
Solid.

IT is strange, how the *Antients* took up *Experiments* upon credit, and yet did build great Matters upon them. The observation of some of the best of them, delivered confidently, is, That a Vessel filled with *Ashes*, will receive the like quantity of Water, that it would have done if it had been empty. But this is utterly untrue, for the Water will not go in by a fifth part; and I suppose, that that fifth part is the difference of the lying close, or open of the *Ashes*; as we see, that *Ashes* alone, if they be hard pressed, will lie in less room; and so the *Ashes* with Air between, lie looser, and with Water closer. For I have not yet found certainly, that the Water it self by mixture of *Ashes* or Dust, will shrink or draw into less room.

35.
Experiment
Solitary,
touching the
Making *Vines*
more fruitful.

IT is reported of credit, That if you lay good store of *Kernels of Grapes* about the *Root of a Vine*, it will make the *Vine* come earlier, and prosper better. It may be tried with other *Kernels*, laid about the *Root of a Plant* of the same kinde; as *Figs, Kernels of Apples, &c.* The cause may be, for that the *Kernels* draw out of the Earth Juice fit to nourish the Tree, as those that would be Trees of themselves, though there were no Root; but the Root being of greater strength, robbeth and devoureth the nourishment, when they have drawn it; as great Fishes devour little.

36.
Experiments
in Consort,
touching
Purging Medicines.

THE operation of *Purging Medicines*, and the causes thereof, have been thought to be a great Secret; and so according to the slothful manner of Men, it is referred to a *Hidden Propriety*, a *Specificall Vertue*, and a *Fourth Quality*, and the like shifts of Ignorance. The Causes of Purging, are divers, All plain and perspicuous, and throughly maintained by experience. The first is, That whatsoever cannot be overcome and digested by the Stomack, is by the Stomack, either put up by *Vomit*, or put down to the *Guts*; and by that Motion of Expulsion in the Stomack and Guts, other Parts of the Body (as the *Orifices* of the *Veins*, and the like) are moved to expel by Consent: For nothing is more frequent then *Motion of Consent* in the *Body of Man*. This Surcharge of the Stomack, is caused either by the Quality of the Medicine, or by the Quantity. The Qualities are three, *Extream Bitter*, as in *Aloes, Coloquintida, &c.* Loathsome, and of horrible taste, as in *Agarik, Black Hellebore, &c.* And of secret Malignity, and disagreement towards *Mans Body*, many times not appearing much in the taste, as in *Scammony, Machoacham, Antimony, &c.* And note well, that if there be any Medicine that *Purgeth*, and hath neither of the first two *Manifest Qualities*, is to be held suspected as a kinde of *Poyson*; For that it worketh either by *Corrosion*, or by a *secret Malignity*, and *Enmity to Nature*; and therefore such Medicines are warily to be prepared and used. The quantity of that which is taken, doth also cause Purging, as we see in a great quantity of new Milk from the Cow, yea, and a great quantity of Meat: For

Surfeits

Surfeits many times turn to *Purges*, both upwards and downwards. Therefore we see generally, that the working of *Purging Medicines* cometh two or three hours after the *Medicines* taken: For that the *Stomack* first maketh a proof, whether it can concoct them. And the like happeneth after *Surfeits*, or *Milk* in too great quantity.

A second cause is *Mordication* of the *Orifices* of the *Parts*, especially of the *Mesentery Veins*; as it is seen, that *Salt*, or any such thing that is sharp and biting, put into the *Fundament*, doth provoke the part to expel, and *Mustard* provoketh sneezing; and any sharp thing to the *eyes* provoketh tears. And therefore we see, that almost all *Purgers* have a kinde of twitching and vellication, besides the griping which cometh of wind. And if this *Mordication* be in an over-high degree, it is little better than the *Corosion* of *Poyson*; and it cometh to pass sometimes in *Antimony*, especially if it be given to *Bodies* not repleat with humors; for where humors abound, the humors save the parts.

The third cause is *Attraction*: For I do not deny, but that *Purging Medicines* have in them a direct force of *Attraction*; as *Drawing-Plaisters* have in *Surgery*: And we see *Sage*, or *Bitony* bruised, *Sneezing-powder*, and other *Powders* or *Liquors* (which the *Physicians* call *Errhines*) put into the *Nose*, draw *Flegm* and *Water* from the *Head*; and so it is in *Apoplegmatisms* and *Gargarisms* that draw the *Rheume* down by the *Palat*. And by this vertue, no doubt, some *Purgers* draw more one humor, and some another, according to the opinion received: As *Rubarb* draweth *Choler*, *Sean Melancholy*, *Agarack* *Flegm*, &c. but yet (more or less) they draw promiscuously. And note also, that besides *Sympathy* between the *Purger* and the *Humor*, there is also another cause, why some *Medicines* draw some humor more than another; and it is, for that some *Medicines* work quicker than others; and they that draw quick, draw onely the lighter, and more fluid humors; they that draw slow, work upon the more tough, and viscuous humors. And therefore, men must beware how they take *Rubarb*, and the like, alone, familiarly; for it taketh onely the lightest part of the humor away, and leaveth the *Mass* of *Humors* more obstinate. And the like may be said of *Worm-wood*, which is so much magnified.

The fourth cause is *Flatuosity*: For wind stirred, moveth to expel; and we finde that (in effect) all *Purgers* have in them a raw *Spirit* or *Wind*, which is the principal cause of *Tortion* in the *Stomack* and *Belly*. And therefore *Purgers* leese (most of them) the vertue, by decoction upon the fire; and for that cause are chiefly given in *Infusion*, *Juyce*, or *Powder*.

The fifth cause is *Compression* or *Crushing*: As when *Water* is crushed out of a *Sponge*: So we see that taking cold moveth loosness by contraction of the *Skin*, and outward parts; and so doth *Cold* likewise cause *Rheums* and *Defluctions* from the *Head*, and some *Astringent Plaisters* crush out purulent *Matter*. This kinde of operation is not found in many *Medicines*: *Mirabolanes* have it, and it may be the *Barks* of *Peaches*; for this vertue requireth an *Astriction*, but such an *Astriction*, as is not grateful to the *Body* (for a pleasing *Astriction* doth rather binde in the humors, than expel them:) And therefore such *Astriction* is found in things of an harrish taste.

The sixth cause is *Lubrefaction* and *Relaxation*: As we see in *Medicines Emolliens*, such as are *Milk*, *Honey*, *Mallows*, *Lettuce*, *Mercurial*, *Pellitory of the Wall*, and others. There is also a secret vertue of *Relaxation* of *Cold*; for the heat of the *Body* bindeth the *Parts* and *Humors* together, which

Cold

37.

38.

39.

40.

41.

Cold, relaxeth: As it is seen in *Urine*, *Blood*, *Pottage*, or the like; which, if they be cold, break and dissolve. And by this kinde of *Relaxation*, Fear loosneth the *Belly*; because the heat retiring inwards towards the *Heart*, the *Guts*, and other parts are relaxed; in the same manner as Fear also causeth trembling in the *Sinews*. And of this kinde of *Purgers* are some *Medicines* made of *Mercury*.

42. The seventh cause is *Absterfion*, which is plainly a *scouring off*, or *Incision* of the more *viscous humors*, and making the *humors* more fluid, and cutting between them, and the part; as is found in *Nitrous Water*, which scoureth *Linnen-Cloth* (speedily) from the foulness. But this *Incision* must be by a *Sharpness*, without *Attrition*; which we finde in *Salt*, *Wormwood*, *Oxymel*, and the like.

43. There be *Medicines* that move *Stools*, and not *Urine*; some other *Urine*, and not *Stools*. Those that *Purge by Stool*, are such as enter not at all, or little into the *Mesentery Veins*; but either at the first, are not digestible by the *Stomack*, and therefore move immediately downwards to the *Guts*; or else are afterwards rejected by the *Mesentery Veins*, and so turn likewise downwards to the *Guts*; and of these two kinds, are most *Purgers*. But those that move *Urine*, are such as are well digested of the *Stomack*, and well received also of the *Mesentery Veins*; so they come as far as the *Liver*, which sendeth *Urine* to the *Bladder*, as the *Whey of Blood*: And those *Medicines*, being opening and piercing, do fortifie the operation of the *Liver*, in sending down the *Wheyey part* of the *Blood* to the *Reins*. For *Medicines Urinative* do not work by rejection and indigestion, as *Solutive* do.

44. There be divers *Medicines*, which in greater quantity move *Stool*, and in smaller, *Urine*; and so contrariwise, some that in greater quantity move *Urine*, and in smaller *Stool*. Of the former sort is *Rubarb*, and some others. The cause is, for that *Rubarb* is a *Medicine*, which the *Stomack* in a small quantity doth digest, and overcome (being not *Flatuous* nor *Loathsome*,) and so sendeth it to the *Mesentery Veins*; and so being opening, it helpeth down *Urine*: But in a greater quantity, the *Stomack* cannot overcome it, and so it goeth to the *Guts*. *Pepper*, by some of the *Ancients*, is noted to be of the second sort; which being in small quantity, moveth wind in the *Stomack* or *Guts*, and so expelled by *Stool*; but being in greater quantity, dissipateth the wind, and it self getteth to the *Mesentery Veins*, and so to the *Liver* and *Reins*; where, by *Heating* and *Opening*, it sendeth down *Urine* more plentifully.

Drinks that
are most nourishing.

WE have spoken of *Evacuating* of the *Body*, we will now speak something of the filling of it by *Restoratives* in *Consumptions* and *Emaciating Diseases*. In *Vetegables*, there is one part that is more nourishing than another; as *Grains* and *Roots* nourish more than the *Leaves*, insomuch as the *Order of the Foliatans* was put down by the *Pope*, as finding *Leaves* unable to nourish *Mans Body*. Whether there be that difference in the *Flesh* of *Living Creatures*, is not well enquired; as whether *Livers*, and other *Entrails*, be not more nourishing than the outward *Flesh*. We finde that amongst the *Romans*, a *Gooses Liver* was a great delicacy; insomuch, as they had artificial means to make it fair, and great; but whether it were more nourishing, appeareth not. It is certain, that *Marrow* is more nourishing than *Fat*. And I conceive, that some decoction of *Bones* and *Sinews*, stamped and well strained, would be a very nourishing *Broth*: We finde also, that *Scotch Skinck* (which is a *Pottage* of strong nourishment) is made

made with the Knees and Sinews of Beef, but long boiled: *Jelly* also, which they use for a Restorative, is chiefly made of Knuckles of Veal. The Pulp, that is within the Crasfish or Crab, which they spice and butter, is more nourishing then the flesh of the Crab, or Crasfish. The Yolks of Eggs are clearly more nourishing than the Whites. So that it should seem, that the parts of *Living Creatures* that lie more inwards, nourish more than the outward flesh; except it be the Brain, which the Spirits prey too much upon, to leave it any great vertue of nourishing. It seemeth for the nourishing of aged Men, or Men in Consumptions, some such thing should be devised, as should be half *Chylus*, before it be put into the stomach.

Take two large Capons, perboil them upon a soft fire, by the space of an hour or more, till in effect all the Blood be gone. Add in the decoction the Pill of a Sweet-Lemmon, or a good part of the Pill of a Citron, and a little Mace. Cut off the Shanks, and throw them away; then with a good strong Chopping-knife, mince the two Capons, Bones and all, as small as ordinary minced Meat; put them into a large neat Boulter, then take a Kilderkin, sweet, and well-seasoned, of four Gallons of Beer of Eight shillings strength, new as it cometh from the Tunning; make in the Kilderkin a great Bung-hole of purpose, then thrust into it, the Boulter (in which the Capons are) drawn out in length; let it steep in it three days and three nights, the Bung-hole open to work, then close the Bung hole, and so let it continue a day and a half, then draw it into Bottles, and you may drink it well after three days Bottling, and it will last six weeks (approved). It drinketh fresh, flowreth, and mantleth exceedingly, it drinketh not newish at all, it is an excellent drink for a Consumption to be drunk either alone, or carded with some other Beer. It quenbeth thirst, and hath no whit of windines. Note, that it is not possible, that Meat and Bread, either in Broths, or taken with Drink, as is used, should get forth into the Veins, and outward Parts, so finely, and easily, as when it is thus incorporate, and made almost a *Chylus* aforehand.

Tryal would be made of the like Brew with *Potado-Roots*, or *Bur-Roots*, or the Pith of *Artichoaks*, which are nourishing Meats: It may be tryed also, with other flesh; as *Pheasant*, *Partridge*, *Young Pork*, *Pig*, *Venison*, especially of *Young Deer*, &c.

A *Mortress* made with the *Brawn* of Capons, stamped, and strained, and mingled (after it is made) with like quantity, at the least, of *Almond Butter*; is an excellent Meat to nourish those that are weak, better than *Black-Manger* or *Jelly*: And so is the *Cullice* of *Cocks*, boiled thick with the like mixture of *Almond Butter*: For the *Mortress* or *Cullice* of it self, is more savory and strong, and not so fit for nourishing of weak Bodies, but the *Almonds* that are not of so high a taste as flesh, do excellently qualifie it.

Indian Maiz hath (of certain) an excellent Spirit of Nourishment; but it must be thoroughly boiled, and made into a *Maiz-Cream* like a *Barley-Cream*. I judge the same of *Rice*, made into a *Cream*; for *Rice* is in *Turky*, and other Countreys of the East, most fed upon, but it must be thoroughly boiled in respect of the hardness of it; and also, because otherwise it bindeth the Body too much.

Pistachoes, so they be good and not musty, joyned with *Almonds* in *Almond Milk*, or made into a *Milk* of themselves, like unto *Almond Milk*, but more green, are an excellent nourisher. But you shall do well, to add a little *Ginger* scraped, because they are not without some subtil windiness.

46.

47.

48.

49.

50.

51. *Milk* warm from the *Cow*, is found to be a great nourisher, and a good remedy in Consumptions: But then you must put into it, when you Milk the *Cow*, two little Bags; the one of *Powder of Mint*, the other of *Powder of Red Roses*; for they keep the Milk somewhat from turning, or crudling in the Stomack; and put in Sugar also for the same cause, and partly for the tastes sake: But you must drink a good draught, that it may stay less time in the Stomack, lest it cruddle: And let the Cup, into which you milk the *Cow*, be set in a greater Cup of hot Water, that you may take 'it warm. And *Cow-milk* thus prepared, I judge to be better for a Consumption, than *As-milk*, which (it is true) turneth not so easily, but it is a little harsh: Marry it is more proper for sharpness of Urine, and Exulceration of the Bladder, and all manner of Lenifyings. *Womens-milk* likewise is prescribed, when all fail; but I commend it not, as being a little too near the Juyce of Mans Body, to be a good nourisher; except it be in Infants, to whom it is natural.
52. *Oyl of sweet Almonds* newly drawn, with Sugar and a little Spice, spread upon Bread toasted, is an excellent nourisher; but then to keep the Oyl from frying in the Stomack, you must drink a good draught of Milde-Beer after it; and to keep it from relaxing the Stomack too much, you must put in a little *Powder of Cinnamon*.
53. The Yolks of Eggs are of themselves so well prepared by Nature for nourishment, as (so they be Potched, or Rear-boyled) they need no other preparation or mixture; yet they may be taken also raw, when they are new laid, with *Malmsey* or *Sweet Wine*. You shall do well to put in some few slices of *Eringium Roots*, and a little *Amber-greece*: For by this means, besides the immediate faculty of nourishment, such drink will strengthen the Back, so that it will not draw down the Urine too fast. For too much Urine doth always hinder nourishment.
54. *Mincing of Meat*, as in *Pies*, and *Buttered minced Meat*, saveth the grinding of the Teeth; and therefore (no doubt) it is more nourishing, especially in Age, or to them that have weak Teeth; but the Butter is not so proper for weak Bodies, and therefore it were good to moisten it with a little Claret Wine, Pill of *Lemmon* or *Orange* cut small, Sugar, and a very little Cinnamon, or Nutmeg. As for *Chuets*, which are likewise Minced-meat; instead of Butter, and Fat, it were good to moisten them, partly with Cream, or Almond, or Pistachomilk, or Barley, or Maiz Cream; adding a little Coriander-seed, and Carraway-seed, and a very little Saffron. The more full handling of Alimentation, we reserve to the due place.
- We have hitherto handled the Particulars, which yield best, and easiest, and plentifullest, Nourishment; and now we will speak of the best Means of conveying, and converting the Nourishment.*
55. The first Means is to procure, that the Nourishment may not be robbed and drawn away; wherein that which we have already said, is very material, to provide, that the Reins draw not too strongly an over-great part of the Blood into Urine. To this add that Precept of *Aristotle*, That Wine be forboren in all Consumptions; for that the Spirits of the Wine do prey upon the Rosside Juyce of the Body, and inter-common with the Spirits of the Body, and so deceive and rob them of their Nourishment. And therefore if the Consumption, growing from the weakness of the Stomack, do force you to use Wine; let it always be burnt, that the quicker Spirits may evaporate, or (at the least) quenched with two little Wedges of Gold, six or seven times repeated. Add also this Provision, that there be not too much expence

of the nourishment, by Exhaling and Sweating: And therefore if the Patient be apt to sweat, it must be gently restrained. But chiefly *Hipocrates* Rule is to be followed, who adviseth quite contrary to that which is in use: Namely, That the Linnen or Garment next the Flesh, be in Winter dry and oft changed; and in Summer seldom changed, and smeared over with Oyl: For certain it is, that any substance that is fat, doth a little fill the Pores of the Body and stay Sweat in some degree. But the more cleanly way is to have the Linnen smeared lightly over with Oyl of sweet Almonds, and not to forbear shifting as oft as is fit.

56.

The second Means is to send forth the nourishment into the parts more strongly, for which, the working must be by strengthening of the Stomack; and in this, because the Stomack is chiefly comforted by Wine and hot things, which otherwise hurt, it is good to resort to outward applications to the Stomack: Wherein it hath been tryed, that the Quilts of Roses, Spices, Mastick, Wormwood, Mint, &c. are not so helpful, as to take a Cake of New Bread, and to bedew it with a little *Sack* or *Alegant*, and to dry it, and after it be dried a little before the Fire, to put it within a clean Napkin, and to lay it to the Stomack: For it is certain, that all Flower hath a potent Vertue of *Attrition*, insomuch, as it hardneth a piece of Flesh, or a Flower that is laid in it. And therefore a Bag quilted with Bran, is likewise very good, but it dryeth somewhat too much, and therefore it must not lie long.

57.

The third Means (which may be a branch of the former) is to send forth the nourishment the better by sleep. For we see, that Bears and other Creatures that sleep in the Winter, was exceeding fat: And certain it is, (as it is commonly believed) that Sleep doth nourish much, both for that the Spirits do less spend the nourishment in Sleep, than when living Creatures are awake: And because (that which is to the present purpose) it helpeth to thrust out the nourishment into the parts. Therefore in aged-men, and weak Bodies, and such as abound not with Choler, a short sleep after dinner doth help to nourish; for in such Bodies there is no fear of an over-hasty digestion, which is the inconvenience of *Post-meridian Sleeps*. Sleep also in the morning, after the taking of somewhat of easie digestion; as Milk from the Cow, nourishing Broth, or the like, doth further nourishment: But this would be done sitting upright, that the Milk or Broth may pass the more speedily to the bottom of the Stomack.

58.

The fourth Means is to provide, that the parts themselves may draw to them the nourishment strongly: There is an excellent observation of *Aristotle*, that a great reason why Plants (some of them) are of greater age than Living Creatures is, for that they yearly put forth new Leaves and Boughs; whereas Living Creatures put forth (after their period of growth) nothing that is young, but Hair and Nails, which are Excrements, and no Parts. And it is most certain, that whatsoever is young, doth draw nourishment better, than that which is old; and then (that which is the mystery of that observation) young Boughs and Leaves, calling the Sap up to them, the same nourisheth the Body in the passage. And this we see notably proved also, in that the oft cutting or polling of *Hedges, Trees, and Herbs*, doth conduce much to their lasting. Transfer therefore this observation to the helping of nourishment in Living Creatures: The Noblest and Principal Use whereof is, for the Prolongation of Life; Restauration of some degree of Youth, and Inteneration of the Parts: For certain it is, that there are in Living Creatures Parts that nourish and repair easily, and parts that

nourish and repair hardly; and you must refresh, and renew those that are easie to nourish, that the other may be refreshed, and (as it were) drink in nourishment in the passage. Now we see that *Draught Oxen* put into good Pasture, recover the Flesh of young Beef; and Men after long emaciating Diets, wax plump and fat, and almost new: So that you may surely conclude, that the frequent and wise use of those emaciating Diets, and of Purgings; and perhaps of some kinde of Bleeding, is a principal means of prolongation of life, and restoring some degree of Youth: For as we have often said, *Death* cometh upon Living Creatures like the Torment of *Mezemiis*,

Mortua quinetiam jungebat corpora vivis,

Component Manibusque Manus, atque oribus ora.

For the parts in Mans body easily repairable (as Spirits, Blood, and Flesh) die in the embracement of the parts hardly repairable (as Bones, Nerves, and Membranes) and likewise some Entrails (which they reckon amongst the Spermatical Parts) are hard to repair: Though that division of Spermatical and Menstrual Parts, be but a conceit. And this same observation also may be drawn to the present purpose of nourishing emaciated Bodies: And therefore *Gentle Friction* draweth forth the nourishment, by making the parts a little hungry and heating them, whereby they call forth nourishment the better. This *Friction* I wish to be done in the morning. It is also best done by the Hand, or a piece of Scarlet-Wool, wet a little with Oyl of Almonds mingled with a small quantity of Bay-Salt, or Saffron: We see that the very Currying of Horses doth make them fat, and in good liking.

59.

The fifth means is, to further the very act of *Assimilation of Nourishment*; which is done by some outward *emollients*, that make the parts more apt to Assimilate. For which I have compounded an ointment of excellent odor, which I call *Roman ointment*, *vide* the Receipt. The use of it would be between sleeps; for in the latter sleep, the parts assimilate chiefly.

60.

Experiment
Solitary,
touching
Filum Medicinale.

There be many *Medicines*, which by themselves would do no cure, but perhaps hurt, but being applied in a certain order, one after another, do great cures. I have tried (my self) a Remedy for the *Gout*, which hath seldom failed, but driven it away in Twenty four hours space: It is first to apply a *Pulvis*, of which, *vide* the Receipt, and then a Bath or Fomentation, of which, *vide* the Receipt, and then a Plaister, *vide* the Receipt. The *Pulvis* relaxed the Pores, and maketh the humor apt to exhale. The Fomentation calleth forth the Humor by Vapors; but yet in regard of the way made by the *Pulvis*, draweth gently; and therefore draweth the Humors out, and doth not draw more to it: For it is a Gentle Fomentation, and hath withal a mixture (though very little) of some stupefactive. The Plaister is a moderate Astringent Plaister, which repelleth new humor from falling. The *Pulvis* alone would make the part more soft and weak, and apter to take the defluxion and impression of the Humor. The Fomentation alone, if it were too weak, without way made by the *Pulvis*, would draw forth little; if too strong, it would draw to the part, as well as draw from it. The Plaister alone would pen the Humor already contained in the part, and so exasperate it, as well as forbid new Humor; therefore they must be all taken in order, as is said: The *Pulvis* is to be laid to for two or three hours; the Fomentation for a quarter of an hour, or somewhat better, being used hot, and seven or eight times repeated; the Plaister to continue on still, till the part be well confirmed.

There

THere is a secret way of Cure, unpractised by *Assuetude* of that which in itself hurteth. *Poysons* have been made by some Familiar, as hath been said. *Ordinary Keepers* of the sick of the *Plague*, are seldom infected. Enduring of Tortures, by custom hath been made more easie: The brooking of enormous quantity of Meats, and so of Wine, or strong drink, hath been by custom made to be without Surfeit or Drunkenness. And generally Diseases that are Chronical, as *Coughs*, *Phthisicks*, some kinde of *Palsies*, *Lunacies*, &c. are most dangerous at the first: Therefore a wise *Physitian* will consider, whether a Disease be incurable, or whether the just cure of it be not full of peril; and if he finde it to be such, let him resort to *Palliation*, and alleviate the Symptom without busying himself too much with the perfect cure: And many times (if the Patient be indeed patient) that course will exceed all expectation. Likewise the Patient himself may strive, by little and little to overcome the Symptom in the Exacerbation, and so by time turn suffering into Nature.

61.
Experiment
Solitary,
touching
Cure by Cu-
stoms.

Divers Diseases, especially Chronical (such as *Quartan Agues*) are sometimes cured by *Surfeit* and *Excesses*; as excess of Meat, excess of Drink, extraordinary Fasting, extraordinary stirring, or Lassitude, and the like. The cause is, for that Diseases of continuance, get an adventitious strength from Custom, besides their material cause from the Humors: So that the breaking of the Custom doth leave them onely to their first cause; which, if it be anything weak, will fall off. Besides, such Excesses do excite and spur *Nature*, which thereupon riseth more forcibly against the Disease.

62.
Experiment
Solitary,
touching
Cure by Ex-
cess.

THere is in the Body of Man, a great consent in the Motion of the several parts: We see it is Childrens sport, to prove whether they can rub upon their Brest with one hand, and pat upon their Forehead with another; and straight ways they shall sometimes rub with both hands, or pat with both hands. We see, that when the Spirits that come to the Nostrils, expel a bad sent, the Stomack is ready to expel by vomit. We finde that in *Consumptions of the Lungs*, when *Nature* cannot expel by Cough, Men fall into *Fluxes* of the Belly, and then they die. So in *Pestilent Diseases*, if they cannot be expelled by *Sweat*, they fall likewise into *Loosness*, and that is commonly Mortal. Therefore *Physitians* should ingeniously contrive, how by *Motions* that are in their power, they may excite inward *Motions* that are not in their power, by consent; as by the stench of Feathers, or the like, they cure the rising of the *Mother*.

63.
Experiment
Solitary,
touching
Cure by Mo-
tion of Consent.

Hippocrates *Aphorism*, in *Morbis Minus*, is a good profound *Aphorism*. It importeth, that Diseases contrary to the *Complexion*, *Age*, *Sex*, *Season* of the year, *Diet*, &c. are more dangerous than those that are concurrent. A Man would think it should be otherwise; For that when the Accident of Sicknes, and the Natural disposition, do second the one the other; the Disease should be more forcible. And (so no doubt) it is, if you suppose like quantity of Matter. But that which maketh good the *Aphorism*, is, because such Diseases do shew a greater collection of Matter, by that they are able to overcome those Natural inclinations to the contrary. And therefore in Diseases of that kinde, let the *Physitian* apply himself more to *Purgation*, than to *Alteration*; because the offence is in the quantity, and the qualities are rectified of themselves.

touching
Preparations
before Purg-
ing, and set-
ting of the
Body after-
ward.

Physicians do wisely prescribe, that there be Preparatives used before Just Purgations; for certain it is, that *Purgers* do many times great hurt, if the Body be not accommodated, both before and after the Purgings. The hurt that they do, for want of Preparation before Purgings, is by the sticking of the Humors, and their not coming fair away; which causeth in the Body great perturbations, and ill accidents, during the Purgings; and also the diminishing and dulling of the working of the Medicine it self, that it purgeth not sufficiently: Therefore the work of Preparation is double, to make the Humors fluide and mature, and to make the passages more open; For those both help to make the Humors pass readily: And for the former of these, *Syrups* are most profitable; and for the latter, *Apozums* or *Preparing Broths*; *Clysters* also help lest the *Medicine* stop in the Guts, and work gripingly. But it is true, that Bodies abounding with Humors, and fat Bodies, and open Weather, are *Preparatives* in themselves; because they make the Humors more fluid: But let a *Physician* beware how he purge after hard Frosty Weather, and in a lean Body, without Preparation. For the hurt that they may do after Purgings, it is caused by the lodging of some Humors in ill places; for it is certain, that there be Humors which somewhere placed in the Body, are quiet, and do little hurt; in other places (especially Passages) do much mischief. Therefore it is good after Purgings, to use *Apozums* and *Broths*, not so much opening as those used before Purgings, but *Abstusive* and *Mundifying Clysters* also are good to conclude with, to draw away the relicks of the Humors that may have descended to the lower region of the Body.

66.
Experiment
Solitary,
touching
Stanching of
Blood.

Blood is stanch'd divers ways: First, by *Astringents* and *Repercussive Medicines*. Secondly, by drawing of the Spirits and Blood inwards, which is done by cold; as *Iron* or a *Stone* laid to the Neck doth stanch the Bleeding of the Nose; also it hath been tried, that the *Testicles* being put into sharp *Vinegar*, hath made a sudden recess of the Spirits, and stanch'd Blood. Thirdly, by the Recess of the Blood by Sympathy; so it hath been tried, that the part that bleedeth, being thrust into the body of a *Capon*, *Sheep*, new ript and bleeding, hath stanch'd Blood; the Blood, as it seemeth, sucking and drawing up, by similitude of substance, the Blood it meeteth with, and so it self going back. Fourthly, by Custom and Time; so the Prince of *Aurange*, in his first hurt by the *Spanish Boy*, could finde no means to stanch the Blood, either by *Medicine* or *Ligament*, but was fain to have the Orifice of the Wound stopped by Mens *Thumbs*, succeeding one another for the space at the least of two days; and at the last the Blood by custom onely retired. There is a fifth way also in use, to let Blood in an adverse part for a *Revulsion*.

67.
Experiment
Solitary,
touching
Change of A-
liments and
Medicines.

IT helpeth, both in *Medicine* and *Aliment*, to change and not to continue the same *Medicine* and *Aliment* still. The cause is, for that Nature by continual use of any thing, groweth to a satiety and dulness, either of Appetite or Working. And we see that *Affuetude* of things hurtful, doth make them lesse their force to hurt; As *Poyson*, which with use some have brought themselves to brook. And therefore it is no marvel, though things helpful by custom, lesse their force to help, I count intermission almost the same thing with change; for that, that hath been intermitted, is after a sort new.

IT is found by Experience, that in Diets of *Guaiacum*, *Sarza*, and the like, (especially, if they be strict) the Patient is more troubled in the beginning than a ter continuance; which hath made some of the more delicate sort of Patients, give them over in the midst; Supposing, that if those Diets trouble them so much at first, they shall not be able to endure them to the end. But the cause is, for that all those Diets, to dry up *Humors*, *Rheums*, and the like; and they cannot dry up until they have first attenuated: And while the *Humor* is attenuated, it is more fluid, than it was before, and troubleth the Body a great deal more, until it be dried up, and consumed. And therefore Patients must expect a due time, and not check at them at the first.

68.
Experiment,
Solitary,
touching
Diets.

THE producing of Cold is a thing very worthy the Inquisition, both for use and disclosure of causes. For *Heat* and *Cold* are *Natures* two hands, whereby the chiefly worketh; and *Heat* we have in readiness, in respect of the *Fire*: But for *Cold*, we must stay till it cometh, or seek it in deep Caves, or high Mountains; and when all is done, we cannot obtain it in any great degree: For Furnaces of Fire are far hotter than a Summers Sun, but Vaults or Hills are not much colder than a Winters Frost.

Experiments
in Consort,
touching the
Production of
Cold.

The first means of producing Cold, is that which *Nature* presenteth us withal; namely, the expiring of Cold out of the inward parts of the Earth in *Winter*, when the Sun hath no power to overcome it; the Earth being (as hath been noted by some (*Primum Frigidum*.) This hath been asserted, as well by Ancient, as by Modern *Philosophers*: It was the tenet of *Parmenides* it was the opinion of the Author of the Discourse in *Plutarch*, (for I take it, that Book was not *Plutarchs* own) *De primo Frigido*. It was the opinion of *Telefus*, who hath renewed the Philosophy of *Parmenides*, and is the best of the *Novelists*.

69.

The second cause of Cold is, the contact of cold Bodies; for Cold is Active and Transitive into Bodies adjacent, as well as Heat; which is seen in those things that are touched with Snow or cold Water. And therefore, whosoever will be an *Enquirer* into *Nature*, let him resort to a Conservatory of Snow and Ice; such as they use of delicacy, to cool Wine in Summer: Which is a poor and contemptible use, in respect of other uses that may be made of such Conservatories.

70.

The third cause is the Primary Nature of all Tangible Bodies; for it is well to be noted, That all things whatsoever (Tangible are of themselves) Cold; except they have an accessory heat by Fire, Life, or Motion: For even the Spirit of Wine, or Chymical Oyls, which are so hot in operation, are to the first touch, Cold; and Air it self compressed, and condensed a little by blowing, is Cold.

71.

The fourth cause is, the Density of the Body; for all dense Bodies are colder than most other Bodies, as *Metals*, *Stone*, *Glass*, and they are longer in heating than faster Bodies. And it is certain, that *Earth*, *Dense*, *Tangible*, hold all of the Nature of Cold: The cause is, for that all *Matters Tangible* being Cold, it must needs follow, that where the Matter is most congregated the Cold is the greater.

72.

The fifth cause of Cold, or rather of increase and vehemency of Cold, is A quick Spirit inclosed in a cold Body; as will appear to any that shall attentively consider of Nature in many instances. We see *Nitre* (which hath a quick Spirit) is Cold, more cold to the Tongue than a Stone; so Water

73.

is colder than Oyl, because it hath a quicker Spirit; for all Oyl, though it hath the tangible parts better digested than Water, yet hath it a duller Spirit: So Snow is colder than Water, because it hath more Spirit within it: So we see that Salt put to Ice (as in the producing of the Artificial Ice) increaseth the activity of cold: So some Insecta which have Spirit of Life, as Snakes and Silkworms, are to the touch, Cold. So Quick-silver is the coldest of Metals, because it is fullest of Spirit.

74.

The sixth cause of Cold is, the chassing and driving away of Spirits, such as have some degree of Heat; for the banishing of the Heat must needs leave any Body cold. This we see in the operation of Opium, and Stupefactives upon the Spirits of Living Creatures; and it were not amiss to try Opium by laying it upon the top of a Weather-Glass, to see whether it will contract the Air; but I doubt it will not succeed: For besides that, the virtue of Opium will hardly penetrate thorow such a body as Glass, I conceive that Opium, and the like, make the Spirits flie rather by Malignity, than by Cold.

75.

Seventhly, the same effect must follow upon the exhaling or drawing out of the warm Spirits, that doth upon the flight of the Spirits. There is an opinion, that the Moon is Magnetical of Heat, as the Sun is of Cold and Moisture: It were not amiss therefore to try it with warm waters; the one exposed to the Beams of the Moon, the other with some skreen betwixt the Beams of the Moon and the Water: As we use to the Sun for shade, and to see whether the former will cool sooner. And it were also good to enquire, what other means there may be, to draw forth the Exile heat which is in the Air; for that may be a secret of great power to produce cold Weather.

Experiments
in Consort,
touching the
Version and
Transmutation
of the Air in
to Water.

76.

WE have formerly set down the Means of turning Air into Water, in the Experiment 27. But because it is *Magnale Nature*, and tendeth to the subduing of a very great effect, and is also of manifold use: We will adde some instances in Consort that give light thereunto.

It is reported by some of the Ancients, that Sailers have used every night, to hang Fleeces of Wool on the sides of their ships, the Wool towards the Water; and that they have crushed fresh water out of them, in the Morning, for their use. And thus much we have tried, that a quantity of Wool tied loose together, being let down into a deep Well; and hanging in the middle, some three Fathom from the Water for a night, in the Winter time, increased in weight, (as I now remember) to a fifth Part.

77.

It is reported by one of the Ancients, that in *Lydia*, near *Pergamus*, there were certain Workmen in time of Wars, fled into Caves; and the Mouth of the Caves being stopped by the Enemies, they were famished. But long time after, the dead Bodies were found, and some Vessels which they had carried with them, and the Vessels full of Water; and that Water thicker, and more towards Ice, than common Water; which is a notable instance of Condensation and Induration by Burial under Earth (in Caves) for long time; and of Version also (as it should seem) of the Air into Water; if any of those Vessels were empty. Try therefore a small Bladder hung in Snow, and the like in Nitre, and the like in Quick-silver: And if you finde the Bladders faln or shrunk, you may be sure the Air is condensed by the Cold of those Bodies, as it would be in a Cave under Earth.

It

It is reported of very good credit, that in the *East-Indies* if you set a Tub of Water open in a Room where *Cloves* are kept, it will be drawn dry in Twenty four hours, though it stand at some distant from the *Cloves*. In the Countrey, they use many times in deceit, when their Wooll is new shorn, to set some Pails of Water by in the same Room, to encrease the weight of the Wooll: But it may be, that the Heat of the Wool remaining from the Body of the Sheep, or the heat gathered by the lying close of the Wool, helpeth to draw the watry vapor; but that is nothing to the Version.

It is reported also credibly, that Wool new shorn, being laid casually upon a Vessel of *Verjuice*, after some time hath drunk up a great part of the *Verjuice*, though the Vessel were whole without any flaw, and had not the Bung-hole open. In this instance there is (upon the by) to be noted, the *Percolation* or *Suing* of the *Verjuice* thorow the Wood; for *Verjuice* of it self would never have passed through the Wood: So, as it seemeth, it must be first in a kinde of vapor before it pass.

It is especially to be noted, that the cause that doth facilitate the Version of Air into Water, when the Air is not in gross, but subtilly mingled with tangible Bodies, is, (as hath been partly touched before) for that tangible Bodies have an antipathy with Air; and if they finde any Liquid Body that is more dense near them, they will draw it; and after they have drawn it, they will condene it more, and in effect incorporate it: For we see that a Sponge, or Wooll, or Sugar, or a Woollen-cloth, being put but in part, in Water or Wine, will draw the Liquor higher, and beyond the place, where the Water or Wine cometh: We see also, that *Wood*, *Lute-strings*, and the like, do swell in moist seasons; as appeareth by the breaking of the strings, the hard turning of the Pegs, and the hard drawing forth of Boxes, and opening of Wainscot doors, which is a kinde of infusion; and is much like to an infusion in Water, which will make Wood to swell; as we see in the filling of the Chops of Bowls by laying them in Water. But for that part of these *Experiments*, which concerneth *Attraction* we will reserve into the proper Title of *Attraction*.

There is also a Version of Air into Water, seeing in the sweating of *Marbles*, and other *Stones*; and of *Wainscot* before, and in moist weather. This must be, either by some moisture the Body yieldeth, or else by the moist Air thickned against the hard Body. But it is plain, that it is the latter; for that we see Wood painted with Oyl-colour, will sooner gather drops in a moist night, than Wood alone; which is caused by the smoothness and closeness, which letteth in no part of the vapor, and so turneth it back and thickneth it into Dew. We see also, that breathing upon a Glass, or smooth Body, giveth a Dew; and in Frosty mornings (such as we call *Rime Frosts*) you shall finde drops of Dew upon the inside of Glas-windows: And the Frost it self upon the ground, is but a Version or Condensation of the moist vapors of the night, into a watry substance: Dews likewise, and Rain, are but the returns of moist vapors condensed; the Dew, by the cold onely of the *Summer* departure, which is the gentler cold; Rains, by the cold of that which they call the *Middle Region* of the Air, which is the more violent Cold.

It is very probable (as hath been touched) that that which will turn Water into Ice, will likewise turn Air some degree nearer unto Water. Therefore try the *Experiment* of the Artificial turning Water into Ice (whereof we shall speak in another place) with Air in place of Water, and the

78.

79.

80.

81.

82.

the Ice about it. And although it be a greater alteration to turn Air into Water, than Water into Ice ; yet there is this hope, that by continuing the Air longer time, the effect will follow ; for that artificial conversion of Water into Ice, is the work of a few hours ; and this of Air may be tried by a moneths space, or the like.

Experiments
in Confort,
touching
Induration of
Bodies

Induration or Lapidification of Substances more soft, is likewise another degree of Condensation, and is a great alteration in Nature. The effecting and accelerating thereof, is very worthy to be enquired it is effected by three means.

The first is by Cold, whose property is to condense, and constipate, as hath been said.

The second is by Heat, which is not proper but by consequence ; for the heat doth attenuate, and by attenuation doth send forth the Spirit, and moister part of a Body ; and upon that, the more gross of the tangible parts do contract and serve themselves together ; both to avoid *Vacuum* (as they call it) and also to munite themselves against the force of the Fire, which they have suffered.

And the third is by Assimilation, when a hard Body assimilateth a soft, being contiguous to it.

The examples of *Induration* taking them promiscuously, are many : As the Generation of *Stones* within the Earth, which at the first are but Rude Earth or Clay ; and so of *Minerals*, which come (no doubt) at first of Juyces Concrete, which afterward indurate : And so of *Porcellane*, which is an Artificial Cement, buried in the Earth a long time ; and so the making of *Brick* and *Tile* ; also the making of *Glass*, of a certain *Sand* and *Brake-Roots*, and some other matters ; also the *Exudations* of *Rock*, *Diamonds* and *Chrystal*, which harden with time ; also the *Induration* of *Bead-Amber*, which at first is a soft substance, as appeareth by the *Flies* and *Spiders*, which are found in it, and many more. But we will speak of them distinctly.

83.

For *Indurations* by Cold, there be few Trials of it ; for we have no strong or intense cold here on the surface of the Earth, so near the Beams of the Sun and the Heavens, the likeliest tryal is by Snow and Ice ; for as Snow and Ice, especially being holpen, and their cold activated by Nitre or Salt, will turn Water into Ice, and that in a few hours : So it maybe it will turn Wood or stiff Clay into Stone in longertime. Put therefore into a Conceiving Pit of Snow and Ice, (adding some quantity of Salt and Nitre) a piece of Wood, or a piece of tough Clay, and let it lie a moneth or more.

84.

Another tryal is by *Metalline Waters*, which have virtual Cold in them. Put therefore Wood or Clay into *Smiths water*, or other *Metalline water*, and try whether it will not harden in some reasonable time. But I understand it of *Metalline waters*, that come by washing or quenching, and not of Strong Waters that come by dissolution ; for they are too Corrosive to consolidate.

85.

It is already found, that there are some Natural Spring-waters that will inlapidate Wood ; so as you shall see one piece of Wood, whereof the part above the Water shall continue Wood ; and the part under the Water, shall be turned into a kinde of Gravelly Stone. It is likely those Waters are of some Metalline Mixture ; but there would be more particular inquiry made of them. It is certain, that an Egg was found, having lain many years in the
bottom

bottom of a Moar, where the Earth had somewhat overgrown it: And this Egg was come to the hardness of a stone, and had the colours of the White and Yolk perfect; and the Shell shining in small Grains, like Sugar or Alabaſter.

Another Experience there is of *Induration by Cold*, which is already found, which is, That *Metals* themselves are hardened by often heating, and quenching in Cold-water: For Cold ever worketh most potently upon Heat precedent.

For *Induration by Heat*, it must be considered, That Heat, by the exhaling of the moiſter parts, doth either harden the Body; as in Bricks, Tiles, &c. Or if the Heat be more fierce, maketh the groſſer part of it self, run and melt; as in the making of ordinary Glass, and in the *Vitrification* of Earth, (as we see in the inner parts of Furnaces) and in the *Vitrification* of Brick, and of Metals. And in the former of these, which is the hardning by Baking, without Melting, the Heat hath these degrees: First, It *Indurath*, and then maketh Fragile; and lastly, It doth *Incinerate* and *Calcinate*.

But if you desire to make an *Induration with Toughness*, and less *Fragility*, a middle way would be taken, which is that which *Aristotle* hath well noted, but would be thoroughly verified. It is, to decoct Bodies in Water for two or three days; but they must be such Bodies, into which the Water will not enter; as Stone and Metal. For if they be Bodies, into which the Water will enter, then long seething will rather soften than indurate them, as hath been tried in Eggs, &c. Therefore, softer Bodies must be put into Bottles, and the Bottles hung into Water seething, with the Mouths open above the Water, that no Water may get in: For by this Means the *Virtual Heat* of the Water will enter; and such a Heat, as will not make the Body adust or fragile: But the Substance of the Water will be shut out. This Experiment we made, and it sorted thus, It was tried with a piece of Free-stone, and with Pewter, put into the Water at large; the Free-stone we found received in some Water; for it was softer and easier to scrape, than a piece of the same stone kept dry. But the Pewter, into which no Water could enter, became more white, and liker to Silver, and less flexible by much. There were also put into an Earthen Bottle, placed as before, a good pellet of Clay, a piece of Cheese, a piece of Chalk, and a piece of Free-stone. The Clay came forth almost of the hardness of Stone: The Cheese likewise very hard, and not well to be cut: The Chalk and the Free stone much harder then they were. The colour of the Clay inclined not a whit to the colour of Brick, but rather to white, as in ordinary drying by the Sun. Note, that all the former tryals were made by a boyling upon a good hot fire, renewing the Water as it consumed, with other hot Water; but the boyling was but for Twelve hours onely: And it is like, that the Experiment would have been more effectual, if the boyling had been for two or three days, as we prescribed before.

As touching *Asimilation* (for there is a degree of *Asimilation*, even in Inanimate Bodies) we see examples of it in some Stones, in Clay-grounds, lying near to the top of the Earth where Pebble is; in which you may manifestly see divers Pebbles gathered together, and a crust of Cement or Stone between them, as hard as the Pebbles themselves. And it were good to make a tryal of purpose, by taking Clay, and putting in it divers Pebble-stones, thick set, to see whether in continuance of time, it will not be harder than other Clay of the same lump, in which no Pebbles are set. We see also in Ruins

86.

87.

88.

89.

of old Walls, especially towards the bottom, the Morter will become as hard as the Brick: We see also, that the Wood on the sides of Vessels of Wine, gathereth a crust of *Tartar* harder than the Wood it self; and Scales likewise grow to the Teeth, harder than the Teeth themselves.

90. Most of all, *Induration by Assimilation* appeareth in the bodies of Trees, and Living Creatures: For no nourishment that the Tree receiveth, or that the Living Creature receiveth, is so hard as Wood, Bone, or Horn, &c. but is indurated after by Assimilation.

91.
Experiment
Solitary,
touching the
Version of Water
into Air.

THe Eye of the Understanding, is like the Eye of the Sense: For as you may see great objects through small Crannies, or Levels; so you may see great Axioms of Nature, through small and contemptible instances. The speedy depredation of Air upon watry moisture, and version of the same into Air, appeareth in nothing more visible than in the sudden discharge, or vanishing of a little Cloud of Breath, or Vapor, from Glass or the Blade of a Sword, or any such polished Body; such as doth not at all detain or imbibe the moisture: For the mistinels scattereth and breaketh up suddenly. But the like Cloud, if it were oily or fatty, will not discharge; not because it sticketh faster, but because Air preyeth upon Water, and Flame, and Fire, upon Oyl; and therefore, to take out a spot of Grease, they use a Coal upon brown Paper, because fire worketh upon Grease or Oyl, as Air doth upon Water. And we see Paper oiled, or Wood oiled, or the like, last long moist; but wet with Water, dry or putrifie sooner. The cause is, for that Air meddleth little with the moisture of oyl.

92.
Experiment
Solitary,
touching the
Force of Union.

THere is an admirable demonstration in the same trifling instance of the little Cloud upon Glass, or Gems, or Blades of Swords of the force of Union, even in the least quantities, and weakest Bodies, how much it conduceth to preservation of the present form, and the resisting of a new. For mark well the discharge of that Cloud, and you shall see it ever break up, first in the skirts, and last in the midst. We see likewise, that much Water draweth forth the Juice of the Body infused, but little Water is imbibed by the Body: And this is a principal cause, why, in operation upon Bodies, for their Version or Alteration, the tryal in great quantities doth not answer the tryal in small, and so deceiveth many; for that (I say) the greater Body resisteth more any alteration of Form, and requireth far greater strength in the Active Body that should subdue it.

93.
Experiment
Solitary,
touching the
Producing of
Feathers and
Hairs of di-
vers Colours.

WE have spoken before in the Fifth Instance, of the cause of *Orient Colours* in Birds; which is by the fineness of the Strainer, we will now endeavor to reduce the same Axiom to a Work. For this Writing of our *Sylva Sylvarum*, is (to speak properly) not *Natural History*, but a high kinde of *Natural Magick*. For it is not a description onely of Nature, but a breaking of Nature, into great and strange Works. Try therefore the anointing over of Pigeons, or other Birds, when they are but in their Down, or of Whelps, cutting their Hair as short as may be, or of some other Beast; with some oynment, that is not hurtful to the flesh, and that will harden and stick very close, and see whether it will not alter the colours of the Feathers, or Hair. It is received, that the pulling off the first Feathers of Birds clean, will make the new come forth White: And it is certain, that White is a penurious colour, and where moisture is scant. So Blew Violets, and other Flowers, if they be starved, turn pale and white.

Birds,

Birds, and Horses, by age or scars, turn white; and the hoar Hairs of Men, come by the same reason. And therefore in Birds, it is very likely, that the Feathers that come first, will be many times of divers colours, according to the nature of the Birds; for that the skin is more porous, but when the skin is more shut and close, the Feathers will come white. This is a good Experiment, not onely for the producing of Birds and Beasts of strange colours, but also, for the disclosure of the nature of colours themselves; which of them require a finer porosity, and which a grosser.

IT is a work of providence that hath been truly observed by some; that the Yolk of the Egg conduceth little to the Generation of the Bird, but onely to the nourishment of the same: For if a Chicken be opened when it is new hatched, you shall finde much of the Yolk remaining. And it is needful, that Birds that are shaped without the Females Womb, have in the Egg, as well matter of nourishment, as matter of generation for the Body. For after the Egg is laid, and severed from the body of the Hen, it hath no more nourishment from the Hen, but onely a quickning heat when she sitteth. But Beasts and Men need not the matter of nourishment within themselves; because they are shaped within the Womb of the Female, and are nourished continually from her body.

IT is an inveterate and received opinion, That *Campharides* applied to any part of the Body, touch the Bladder, and exulcerate it, if they stay on long. It is likewise received, that a kinde of *Stone*, which they bring out of the *West-Indies*, hath a peculiar force to move Gravel, and to dissolve the *Stone*; insomuch, as laid but to the Wrest, it hath so forcibly sent down Gravel, as Men have been glad to remove it, it was so violent.

It is received and confirmed by daily experience, that the Soals of the Feet, have great affinity with the Head, and the Mouth of the Stomack: As we see, Going wetshod, to those that use it not, affecteth both; Applications of hot Powders to the Feet, attenuate first, and after dry the Rheume. And therefore a Physician that would be mystical, prescribeth for the cure of the Rheume, That a Man should walk continually upon a Camomil-Alley; meaning, that he should put Camomil within his Socks. Likewise, Pigeons bleeding, applied to the Soals of the Feet, ease the Head; and Soporiferous Medicines applied unto them, provoke sleep.

It seemeth, that as the Feet have a sympathy with the Head; so the Wrests and Hands have a sympathy with the Heart. We see the affects and Passions of the Heart, and Spirits, are notably disclosed by the Pulse: And it is often tryed, that Juyces of *Stock-gilly-flowers*, *Rose-campion*, *Garlick*, and other things, applied to the Wrests, and renewed, have cured long Agues. And I conceive, that washing with certain Liquors the Palms of the Hands, doth much good: And they do well in Heats of Agues to hold in the Hands, Eggs of Alabaster, and Balls of Crystal.

Of these things we shall speak more, when we handle the Title of Sympathy and Antipathy, in the proper place.

THe knowledge of Man (hitherto) hath been determined by the view or sight; so that whatsoever is invisible, either in respect of the fineness of the Body it self, or the smallness of the Parts, or of the subtilty of the

96.

97.

98.

Experiment Solitary, touching the Secret Processes of Nature.

Motion, is little inquired. And yet these be the things that govern Nature principally, and without which, you cannot make any true *Analysis* and *Indications* of the proceedings of Nature. The Spirits or Pneumatics that are in all Tangible Bodies, are scarce known: Sometimes they take them for *Vacuum*, whereas they are the most active of Bodies: Sometimes they take them for Air, from which they differ exceedingly, as much as Wine from Water, and as Wood from Earth: Sometimes they will have them to be Natural Heat, or a Portion of the Element of Fire, whereas some of them are crude and cold: And sometimes they will have them to be the Vertues and Qualities of the Tangible Parts which they see, whereas they are things by themselves: And then, when they come to Plants and Living Creatures, they call them *Souls*. And such superficial speculations they have; like Prospectives that shew things inward, when they are but Paintings. Neither is this a question of words, but infinitely material in Nature: For Spirits are nothing else but a Natural Body, rarified to a Proportion, and included in the Tangible Parts of Bodies, as in an Integument: And they be no less differing one from the other, then the Dense or Tangible Parts: And they are in all Tangible Bodies whatsoever, more or less, and they are never (almost) at rest: And from them, and their Motions, principally proceed *Arefaction*, *Colliquation*, *Concoction*, *Maturation*, *Purefaction*, *Vivification*, and most of the effects of Nature. For, as we have figured them in our *Sapientia Veterum*, in the Fable of *Proserpina*, you shall in the Infernal Regiment hear little doings of Pluto, but most of *Proserpina*: For Tangible Parts in Bodies, are stupid things, and the Spirits do (in effect) all. As for the differences of Tangible Parts in Bodies, the industry of the *Chymists* hath given some light in discerning by their separations, the *Oily*, *Crude*, *Pure*, *Impure*, *Fine*, *Gross*, *Parts of Bodies*, and the like. And the *Physicians* are content to acknowledge, that *Herbs* and *Drugs* have divers parts; as that *Opium* hath a stupefacting part, and a heating part; the one moving Sleep, the other a Sweat following; and that *Ruburb* hath Purging parts, and Astringing parts, &c. But this whole *Inquisition* is weakly and negligently handled. And for the more subtil differences of the Minute parts, and the posture of them in the Body, (which also hath great effects) they are not at all touched: As for the Motions of the Minute Parts of Bodies, which do so great effects, they have not been observed at all; because they are invisible, and incur not to the eye; but yet they are to be deprehended by experience. As *Democritus* said well, when they charged him to hold, that the World was made of such little Moats, as were seen in the Sun. *Atomus* (saith he) *necessitate Rationis & Experientia esse convincitur: Atomum enim nemo nunquam vidit.* And therefore the tumult in the parts of solid Bodies, when they are compressed, which is the cause of all flights of Bodies thorow the Air, and of other Mechanical Motions, (as hath been partly touched before, and shall be thoroughly handled in due place,) is not seen at all, but nevertheless, if you know it not, or inquire it not attentively and diligently, you shall never be able to discern, and muchless to produce, a number of Mechanical Motions. Again, as to the Motions Corporal, within the Enclosures of Bodies, whereby the effects (which were mentioned before) pass between the Spirits and the Tangible parts (which are *Arefaction*, *Colliquation*, *Concoction*, *Maturation*, &c.) they are not at all handled; but they are put off by the names of *Vertues*, and *Natures*, and *Actions*, and *Passions*, and such other *Logical Words*.

IT is certain, that of all *Powers in Nature*, Heat is the chief; both in the Frame of *Nature*; and in the Works of *Art*. Certain it is likewise, that the effects of Heat, are most advanced, when it worketh upon a Body without loss or dissipation of the matter; for that ever betrayed the account. And therefore it is true, that the power of Heat is best perceived in Distillations, which are performed in close Vessels and Receptacles. But yet there is a higher degree; For howsoever Distillations do keep the Body in Cells and Cloysters, without going abroad, yet they give space unto Bodies to turn into Vapor, to return into Liquor, and to separate one part from another. So as *Nature* doth expatiate, although it hath not full liberty; whereby the true and ultime operations of Heat, are not attained: But if Bodies may be altered by Heat, and yet no such Reciprocation of Rarefaction, and of Condensation, and of Separation, admitted; then it is like that this *Proteus* of Matter, being held by the Sleeves, will turn and change into many Metamorphoses. Take therefore a square Vessel of Iron, in form of a Cube, and let it have good thick and strong sides; put it into a Cube of Wood, that may fill it as close as may be, and let it have a cover of Iron as strong (at least) as the sides, and let it be well Luted, after the manner of the *Chymists*; then place the Vessel within burning Coals kept quick kindled, for some few hours space; then take the Vessel from the Fire, and take off the Cover, and see what is become of the Wood, I conceive, that since all Inflammation and Evaporation are utterly prohibited, and the Body still turned upon it self, that one of these two Effects will follow, Either that the Body of the Wood will be turned into a kinde of *Amalgama*, (as the *Chymists* call it,) or, that the finer part will be turned into Air, and the grosser stick as it were baked, and incrustate upon the sides of the Vessel, being become of a denser matter, than the Wood it self, crude. And for another tryal, take also Water, and put it in the like Vessel, stopped as before; but use a gentler Heat, and remove the Vessel sometimes from the fire; and again, after some small time, when it is cold, renew the heating of it, and repeat this alteration some few times; and if you can once bring to pass, that the Water which is one of the simplest of Bodies, be changed in Colour, Odor, or Taste, after the manner of Compound Bodies, you may be sure that there is a great work wrought in Nature, and a notable entrance made in strange changes of Bodies, and productions; and also a way made to do that by Fire, in small time, which the *Sun* and *Age* do in long time. But if the admirable effects of this *Distillation* in close, (for so we call it) which is like the Wombs and Matrices of Living Creatures, where nothing expireth nor separateth: We will speak fully, in the due place. Not that we aim at the making of *Peracelsus* Pigmeyes, or any such prodigious follies; but that we know the effects of Heat will be such, as will scarce fall under the conceit of Man, if the force of it be altogether kept in.

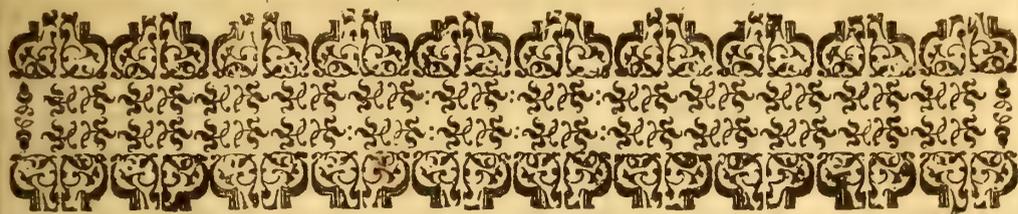

HERE is nothing more certain in *Nature*, than that it is impossible for any Body to be utterly annihilated; but that as it was the work of the Omnipotency of *God*, to make *Somewhat* of *Nothing*: So it requireth the like omnipotency, to turn *Somewhat* into *Nothing*. And therefore it is well said by an obscure Writer of the Sect of the *Chymists*, That there is no such way to effect the strange *Transmutations* of *Bodies*, as to endeavor and urge by all means, the reducing of them to *Nothing*. And herein is contained al-

99.
Experiment
Solitary,
touching the
Power of Heat.

100.
Experiment
Solitary,
touching the
Impossibility
of Annihilation.

So a great secret of Preservation of Bodies from change ; for if you can prohibit, that they neither turn into *Air*, because no *Air* cometh to them, nor go into the *Bodies Adjacent*, because they are utterly Heterogeneous, nor make a round and circulation within themselves ; they will never change, though they be in their Nature never so perishable or mutable. We see how *Flies* and *Spiders*, and the like, get a *Sepulchre* in *Amber*, more durable than the *Monument* and *Embalming* of the *Body* of any *King*. And I conceive the like will be of *Bodies* put into *Quick-silver*. But then they must be but thin, as a leaf or a peece of *Paper* or *Parchment* ; for if they have a greater crassitude, they will alter in their own *Body*, though they spend not. But of this, we shall speak more when we handle the Title of *Conservation of Bodies*.

NATURAL HISTORY.

Century II.

Musick in the Practice, hath been well pursued, and in good Variety; but in the Theory, and especially in the yielding of the Causes of the Practick, very weakly; being reduced into certain Mystical subtilties, and not much truth. We shall therefore, after our manner, joyn the *Contemplative* and *Active Part* together.

Experiments
in Confort
touching
Musick.

All Sounds are either *Musical Sounds*, which we call *Tones*; whereunto there may be an *Harmony*, which *Sounds* are ever equal: As Singing, the Sounds of Stringed, and Wind-Instruments, the Ringing of Bells, &c. or *Immusical Sounds*, which are ever unequal: Such as are the Voice in Speaking, all Whisperings, all Voices of Beasts and Birds (except they be Singing Birds;) all Percussions, of Stones, Wood, Parchment, Skins, (as in Drums) and infinite others.

101.

The Sounds that produce *Tones*, are ever from such *Bodies* as are in their Parts and Pores equal; as well as the Sounds themselves are equal: And such are the Percussions of Metal, as in *Bells*; of *Glass*, as in the flipping of a *Drinking Glass*; of *Air*, as in *Mens Voices* whilst they sing, in *Pipes*, *Whistles*, *Organs*, *Stringed Instruments*, &c. And of *Water*, as in the *Nightingals Pipes of Regals*, or *Organs*, and other *Hydraulicks*, which the Ancients had; and *Nero* did so much esteem, but are now lost. And if any Man think, that the *String* of the *Bow*, and the *String* of the *Vial*, are neither of them equal Bodies, and yet produce *Tones*; he is in an error. For the Sound is not created between the *Bow* or *Plectrum*, and the *String*; but between the *String* and the *Air*; no more than it is between the *Finger* or *Quill*, and the *String* in other Instruments. So there are (in effect) but three *Percussions* that

102.

create Tones ; Percussion of Metals (comprehending *Glaß*, and the like) Percussions of Air, and Percussions of Water.

103.

The *Diapason* or *Eight* in *Musick*, is the sweetest Concord ; inſomuch, as it is in effect an *Unison* ; as we ſee in *Lutes* that are ſtrung in the baſe ſtrings with two ſtrings, one an *Eighth* above another, which make but as one ſound ; and every *Eighth Note* in *Ascent*, (as from *Eight* to *Fifteen*, from *Fifteen* to *Twenty two*, and ſo in *inſinitum*) are but *Scales of Diapason*. The cauſe is dark, and hath not been rendred by any, and therefore would be better contemplated. It ſeemeth that *Air* (which is the ſubject of *Sounds*) in *Sounds* that are not *Tones* (which are all unequal as hath been ſaid) admitteth much variety ; as we ſee in the *Voices of Living Creatures*, and likewiſe in the *Voices of ſeveral Men* ; for we are capable to diſcern ſeveral *Men* by their *Voices*) and in the *Conjugation of Letters*, whence *Articulate Sounds* proceed ; which of all others, are moſt various. But in the *Sounds* which we call *Tones* (that are ever equal) the *Air* is not able to caſt it ſelf into any ſuch variety ; but is forced to recur into one and the ſame *Poſture* or *Figure*, onely differing in greatneſs and ſmalneſs. So we ſee *Figures* may be made of *Lines*, crooked and ſtraight, in infinite variety, where there is inequality ; but *Circles* or *Squares*, or *Triangles Equilateral*, (which are all *Figures of equal Lines*) can differ but in greater or leſſer.

104.

It is to be noted (the rather, leſt any *Man* ſhould think that there is any thing in this number of *Eight*, to create the *Diapason*) that this computation of *Eight*, is a thing rather received than any true computation. For a true computation ought ever to be, by diſtribution into equal *Portions*. Now there be intervenient in the riſe of *Eight* (in *Tones*) two *Beemols* or *Half-Notes* ; ſo as if you divide the *Tones* equally, the *Eighth* is but *Seven whole and equal Notes* : And if you ſubdivide that into *Half-Notes*, (as it is in the ſtops of a *Lute*) it maketh the number of *Thirteen*.

105.

Yet this is true, That in the ordinary *Riſes* and *Falls* of the *Voice* of *Man* (not meaſuring the *Tone* by whole *Notes* and *Half Notes*, which is the equal *Measure*) there fall out to be two *Beemols* (as hath been ſaid) between the *Unison* and the *Diapason* ; and this varying is natural. For if a *Man* would endeavor to raiſe or fall his *Voice* ſtill by *Half-Notes*, like the ſtops of a *Lute*, or by whole *Notes* alone, without *Halves* as far as an *Eighth* ; he will not be able to frame his *Voice* unto it, which ſheweth, that after every three whole *Notes*, *Nature* requireth, for all *Harmonical uſe*, one *Half-Note* to be interpoſed.

106.

It is to be conſidered, That whatſoever vertue is in *Numbers*, for con-
ducing to concert of *Notes*, is rather to be aſcribed to the *Ante-number*, than to the *Emire-number* ; as namely, that the *Sound* returneth after *Six*, or after *Twelve* : So that the *Seventh* or the *Thirteenth* is not the *Matter*, but the *Sixth*, or the *Twelfth* ; and the *Seventh* and the *Thirteenth*, are but the *Limits* and *Boundaries* of the *Return*.

107.

The *Concords* in *Musick* which are *Perfect*, or *Semiperfect*, between the *Unison* and the *Diapason*, are the *Fifth*, which is the moſt *Perfect* ; the *Third* next, and the *Sixth* which is more harſh : And as the *Anciens* eſteemed, and ſo do my ſelf, and ſome other yet, the *Fourth* which they call *Diateſſeron* ; as for the *Tenth*, *Twelfth*, *Thirteenth*, and ſo in *inſinitum*, they be but *Recurrences* of the former ; viz. of the *Third*, the *Fifth*, and the *Sixth*, being an *Eighth* reſpectively from them.

For

For *Discords*, the Second and the Seventh, are of all others, the most odious in *Harmony* to the Sense; whereof, the one is next above the *Vnison*, the other next under the *Diapason*; which may shew, that *Harmony* requireth a competent distance of Notes.

In *Harmony*, if there be not a *Discord* to the *Base*, it doth not disturb the *Harmony*, though there be a *Discord* to the higher parts; so the *Discord* be not of the Two that are odious: And therefore the ordinary Concert of Four parts consisteth of an Eighth, a Fifth, and a Third to the *Base*; but that Fifth is a Fourth to the Treble, and the Third is a Sixth. And the cause is, for that the *Base* striking more Air, doth overcome and drown the Treble (unless the *Discord* be very odious) and so hideth a small imperfection. For we see, that in one of the lower strings of a Lute, there soundeth not the sound of the Treble, nor any mixt sound, but onely the sound of the *Base*.

We have no *Musick* of *Quarter-Notes*, and it may be, they are not capable of *Harmony*; for we see the *Half-Notes* themselves do but interpose sometimes. Nevertheless, we have some *Slides* or *Relishes* of the Voice or Strings, as it were, continued without Notes, from one Tone to another, rising or falling, which are delightful.

The causes of that which is *Pleasing* or ingrate to the *Hearing*, may receive light by that which is *Pleasing* or ingrate to the *Sight*. There be two things pleasing to the sight (leaving *Pictures* and *Shapes* aside, which are but *Secondary Objects*, and please or displease but in Memory;) these two are Colours and Order. The pleasing of Colour symbolizeth with the *Pleasing* of any *Single Tone* to the Ear; but the pleasing of Order doth symbolize with *Harmony*. And therefore we see in *Garden-knots*, and the *Frets of Houses*, and all equal and well answering *Figures*, (as *Globes*, *Pyramides*, *Cones*, *Cylinders*, &c.) how they please; whereas unequal *Figures* are but *Deformities*. And both these pleasures, that of the Eye, and that of the Ear, are but the effects of equality, good proportion, or correspondence: So that (out of question) Equality and Correspondence are the causes of *Harmony*. But to finde the Proportions of that Correspondence, is more abstruse; whereof, notwithstanding we shall speak somewhat (when we handle *Tones*, in the general enquiry of Sounds.

Tones are not so apt altogether to procure *Sleep*, as some other sounds: As the *Wind*, the *Purling of Water*, *Humming of Bees*, a sweet *Voice* of one that readeth, &c. The cause whereof is, for that *Tones*, because they are equal and slide not, do more strike and erect the Sense, than the other. And overmuch attention hindereth sleep.

There be in *Musick*, certain *Figures* or *Tropes*, almost agreeing with the *Figures* of *Rhetorick*, and with the *Affections* of the *Minde*, and other *Senses*. First, The *Division* and *Quavering*, which please so much in *Musick*, have an agreement with the Glittering of Light; As the *Moon-Beams* playing upon a *Wave*. Again, the *Falling* from a *Discord* to a *Concord*, which maketh great sweetness in *Musick*, hath an agreement with the *Affections*, which are reintegrated to the better, after some dislikes; it agreeth also with the taste, which is soon glutted with that which is sweet alone. The sliding from the Close or Cadence, hath an agreement with the *Figure* in *Rhetorick*, which they call *Præter Expectatum*; for there is a pleasure, even in being deceived. The Reports and Fuges have an agreement with the *Figures* in *Rhetorick* of Repetition and Traduction. The *Tripl's* and *Changing of Times*, have an agreement with

108.

109.

110.

111.

112.

113.

the changes of Motions ; as when Galliard time, and Measure time, are in the Medly of one Dance.

114.

It hath been anciently held, and observed, That the *Sense of Hearing*, and the *Kindes of Musick*, have most operation upon *Manners* ; as to encourage Men, and make them warlike ; to make them soft and effeminate ; to make them grave ; to make them light ; to make them gentle and inclined to pity, &c. The cause is, for that the *Sense of Hearing* striketh the Spirits more immediately, than the other *Senses*, and more incorporeally than the *Smelling* : For the *Sight*, *Taste*, and *Feeling*, have their Organs, not of so present and immediate access to the Spirits, as the *Hearing* hath. And as for the *Smelling* (which indeed worketh also immediately upon the Spirits, and is forcible while the object remaineth) it is with a communication of the Breath or Vapor of the object oderate : But *Harmony* entring easily, and mingling not at all, and coming with a manifest motion ; doth by custom of often affecting the Spirits, and putting them into one kinde of posture, alter not a little the nature of the Spirits, even when the object is removed. And therefore we see, that *Tunes* and *Airs*, even in their own nature, have in themselves some affinity with the *Affections* : As there be *Merry Tunes*, *Doleful Tunes*, *Solemn Tunes* ; *Tunes* inclining Mens mindes to *Pity*, *Warlike Tunes*, &c. So as it is no marvel, if they alter the Spirits, considering that *Tunes* have a predisposition to the Motion of the Spirits in themselves. But yet it hath been noted, that though this variety of *Tunes*, doth dispose the Spirits to variety of *Passions*, conform unto them ; yet generally, *Musick* feedeth that disposition of the Spirits which it findeth. We see also, that several *Airs* and *Tunes*, do please several *Nations*, and *Persons* according to the sympathy they have with their Spirits.

Experiments
in Consort,
touching
Sounds ; and
first touching
the Nullity,
and Entiry of
Sounds.

Perceptive hath been with some diligence inquired ; and so hath the Nature of Sounds, in some sort, as far as concerneth *Musick*, but the Nature of Sounds in general, hath been superficially observed. It is one of the subtillest pieces of Nature. And besides, I practise, as I do advise : Which is after long inquiry of things, immerse in matter, to enterpose some subject which is immateriate or less materiate ; such as this of Sounds : To the end, that the intellect may be rectified, and become not partial.

115.

It is first to be considered, what great motions there are in Nature which pass without sound or noise. The Heavens turn about in a most rapide motion, without noise to us perceived, though in some dreams they have been said to make an excellent Musick. So the motions of the Comets, and Fiery Meteors (as *Stella Cadens*, &c.) yield no noise. And if it be thought, that it is the greatness of distance from us, whereby the sound cannot be heard ; we see that Lightnings and Coruscations, which are near at hand, yield no sound neither ; and yet in all these, there is a percussion and division of the Air. The Winds in the Upper Region (which move the Clouds above (which we call the Rack) and are not perceived below) pass without noise. The lower Winds in a Plain, except they be strong, make no noise ; but amongst Trees, the noise of such Winds will be perceived. And the Winds (generally) when they make a noise, do ever make it unequally, rising and falling, and sometimes (when they are vehement) trembling at the height of their blast. Rain or Hail falling, though vehemently, yieldeth no noise, in passing through the Air, till it fall upon the Ground, Water, Houses, or the like. Water in a River (though a swift stream, is not heard in the Channel,

but

but runneth in silence, if it be of any depth ; but the very Stream upon Shallows, or Gravel, or Pebble, will be heard. And Waters, when they beat upon the Shore, or are straitned, (as in the falls of Bridges) or are dashed against themselves by Winds, give a roaring noise. Any peece of Timber, or hard Body, being thrust forwards by another Body contiguous, without knocking giveth no noise. And so Bodies in weighing, one upon another, though the upper Body press the lower Body down, make no noise. So the motion of the Minute parts of any solid Body, (which is the principal cause of violent Motion, though unobserved) passeth without sound : For that sound, that is heard sometimes, is produced onely by the breaking of the Air, and not by the impulsion of the parts. So it is manifest, that where the anterior Body giveth way as fast as the posterior cometh on, it maketh no noise, be the motion never so great or swift.

Air open and at large, maketh no noise, except it be sharply percussed : as in the sound of a string, where Air is percussed by a hard and stiff Body, and with a sharp loose : For if the string be not straitned, it maketh no noise ; but where the Air is pent and straitned, there breath or other blowing (which carry but a gentle percussion) suffice to create sound ; as in Pipes and Wind Instruments. But then you must note, that in *Recorders* which go with a gentle breath, the Concave of the Pipe (were it not for the Fipple that straitneth the Air much more then the simple Concave) would yield no sound. For, as for other Wind-Instruments, they require a forcible breath, as *Trumpets, Cornets, Hunters, Horns, &c.* Which appeareth by the blown Cheeks of him that windeth them. *Organs* also are blown with a strong wind by the Bellows. And note again, that some kinde of Wind-Instruments are blown at a small hole in the side, which straitneth the breath at the first entrance ; the rather, in respect of their traverse, and stop above the hole which performeth the Fipples part ; as it is seen in *Flutes* and *Fifes*, which will not give sound by a blast at the end, as *Recorders* do, &c. Likewise in all Whistling, you contract the Mouth ; and to make it more sharp, Men sometimes use their finger.

But in open Air, if you throw a Stone or a Dart, they give no sound : No more do Bullets, except they happen to be a little hollowed in the casting ; which hollownes penneth the Air : Nor yet Arrows, except they be ruffled in their Feathers, which likewise penneth the Air. As for small Whistles or Shepherds Oaten-Pipes, they give a sound, because of their extream slenderness, whereby the Air is more pent than in a wider Pipe. Again, the voices of Men and Living Creatures, pass through the Throat, which penneth the breath. As for the *Jews-Harp*, it is a sharp percussion, and besides hath the vantage of penning the Air in the Mouth.

Solid Bodies, if they be very softly percussed, give no sound ; as when a Man treadeth very softly upon Boards. So Chests or Doors in fair weather, when they open easily, give no sound. And Cart-wheels squeek not when they are liquored.

The *Flame of Tapers* or *Candles*, though it be a swift motion and breaketh the Air, yet passeth without sound. Air in Ovens, though (no doubt) it doth (as it were) boil, and dilate it self, and is repercussed, yet it is without noise.

Flame percussed by Air, giveth a noise ; As in blowing of the Fire by Bellows, greater than if the Bellows should blow upon the Air it self. And so likewise Flame percussing the Air strongly (as when Flame suddenly taketh and openeth) giveth a noise : So great Flames, whiles the one impelleth the other, give a bellowing sound.

116.

117.

118.

119.

120.

There is a conceit runneth abroad, that there should be a White Powder, which will discharge a piece without noise, which is a dangerous experiment, if it should be true: For it may cause secret Murthers, but it seemeth to me impossible; for if the Air pent, be driven forth and strike the Air open, it will certainly make a noise. As for the White Powder, (if any such thing be that may extinguish or dead the noise) it is like to be a mixture of Petre and Sulphure, without Coal. For Petre alone will not take Fire. And if any Man think, that the sound may be extinguished or deaded, by discharging the pent Air, before it cometh to the Mouth of the Peece, and to the open Air, that is not probable; for it will make more divided sounds: As if you should make a Cross-barrel hollow, thorow the Barrel of a Peece, it may be it would give several sounds, both at the Nose and the sides. But I conceive, that if it were possible to bring to pass, that there should be no Air pent at the Mouth of the Peece, the Bullet might flie with small or no noise. For first it is certain, there is no noise in the Percussion of the Flame upon the Bullet. Next the Bullet, in piercing thorow the Air, maketh no noise, as hath been said; and then, if there be no pent Air, that striketh upon open Air, there is no cause of noise, and yet the flying of the Bullet will not be staid. For that motion (as hath been oft said) is in the parts of the Bullet, and not in the Air. So a tryal must be made by taking some small Concave of *Minal*, no more than you mean to fill with Powder, and laying the Bullet in the Mouth of it half out in the open Air.

121.

I heard it affirmed by a Man that was a great dealer in Secrets, but he was but vain; That there was a *Conspiracy* (which himself hindred) to have killed Queen *Mary*, Sisterto Queen *Elizabeth*, by a *Burning-Glass*, when she walked in *St. James Park*, from the Leads of the House. But thus much, no doubt, is true, That if *Burning-Glasses* could be brought to a great strength, (as they talk generally of *Burning-Glasses*, that are able to burn a Navy) the Percussion of the Air alone, by such a *Burning-Glass*, would make no noise; no more than is found in *Corruscations*, and *Lightnings* without *Thunders*.

122.

I suppose that *Impression* of the *Air* with *Sounds*, asketh a time to be conveyed to the Sense, as well as the *Impression* of *Species visibile*, or else they will not be heard. And therefore, as the Bullet moveth so swift, that it is invisible, so the same swiftness of motion maketh it inaudible; for we see that the apprehension of the Eye, is quicker then that of the Ear.

123.

All *Eruptions of Air*, though small and slight, give an entity of sound, which we call *Crackling*, *Puffing*, *Spiting*, &c. As in Bay-salt, and Bay-leaves cast into the fire; so in *Chestnuts*, when they leap forth of the Ashes, so in green wood laid upon the fire, especially *Roots*; so in *Candles* that spit flame, if they be wet; so in *Rasping*, *Sneezing*, &c. So in a *Rose leaf* gathered together into the fashion of a *Purse*, and broken upon the *Forehead*, or *Back of the Hand*, as *Children* use.

124.

Experiments
in Consort,
touching
Production,
Conservation,
and Delation
of Sounds; and
the office of the
Air therein.

THE cause given of Sound, that it should be an *Elision of the Air* (whereby, if they mean any thing, they mean *Cutting* or *Dividing*, or else an *Attenuating* of the Air) is but a term of Ignorance; and the motion is but a catch of the Wit upon a few Instances, as the manner is in the *Philosophy* received. And it is common with Men, that if they have gotten a pretty expression by a word of *Art*, that expression goeth currant, though it be empty of matter. This conceit of *Elision*, appeareth most manifestly

to

to be false, in that the Sound of a Bell-string, or the like, continueth melting, sometime after the Percussion; but ceaseth straight-ways, if the Bell or String be touched and stayed; whereas, if it were the *Elifion* of the *Air*, that made the Sound, it could not be that the touch of the Bell or String, should extinguish so suddenly that motion, caused by the *Elifion* of the *Air*. This appeareth yet more manifestly, by Chiming with a Hammer upon the outside of a Bell; for the Sound will be according to the inward Concave of the Bell: Whereas the *Elifion* or *Attenuation* of the *Air* cannot be, but onely between the Hammer, and the outside of the Bell. So again, if it were an *Elifion*, a broad Hammer, and a Bodkin, struck upon Metal, would give a diverse Tone, as well as a diverse Loudness: But they do not so; for though the Sound of the one be louder, and of the other softer, yet the Tone is the same. Besides, in *Eccho's* (whereof some are as loud as the Original Voice) there is no new *Elifion*, but a Repercussion onely. But that, which convinceth it most of all, is, That Sounds are generated, where there is no Air at all. But these, and the like conceits, when Men have cleared their Understanding, by the light of Experience, will scatter and break up like a Mist.

It is certain, that Sounds is not produced at the first, but with some Local Motion of the Air or Flame, or some other *Medium*; nor yet without some resistance, either in the Air, or the Body percussed. For if there be a meer yielding or cession, it produceth no Sound, as hath been said. And therein Sounds differ from Light or Colours which pass through the Air, or other Bodies, without any Local Motion of the Air, either at the first, or after. But you must attentively distinguish between the Local Motion of the Air (which is but *Vehiculum causa*, *A Carrier of the Sounds*;) and the Sounds themselves conveyed in the Air. For as to the former, we see manifestly, that no Sound is produced (no not by Air it self against other Air, as in Organs, &c.) but with a perceptible Blast of the Air, and with some resistance of the Air stricken. For, even all Speech, (which is one of the gentlest Motions of Air,) is with expulsion of a little Breath. And all Pipes have a blast, as well as a Sound. We see also manifestly, that Sounds are carried with Wind: And therefore Sounds will be hard further with the Wind, than against the Wind; and likewise, do rise and fall with the intension or remission of the Wind: But for the Impression of the Sound, it is quite another thing, and is utterly without Local Motion of the Air, perceptible; and in that resembleth the species visible: For after a Man hath lured, or a Bell is rung, we cannot discern any Perceptible Motion (at all) in the Air, as long as the sound goeth, but onely at the first. Neither doth the Wind (as far as it carrieth a Voice) with the Motion thereof, confound any of the delicate, and Articulate Figurations of the Air, in variety of Words. And if a Man speak a good loudness against the flame of a Candle, it will not make it tremble much; though most, when those Letters are pronounced, which contract the mouth, as F, S, V, and some others. But gentle breathing, or blowing without speaking, will move the Candle far more. And it is the more probable, that Sound is without any Local Motion of the Air, because as it differeth from the sight, in that it needeth a Local Motion of the Air at first: So it paralleleth in so many other things with the sight, and radiation of things invisible, which (without all question) induce no Local Motion in the Air, as hath been said.

Nevertheless it is true, that upon the noise of Thunder, and great Ordinance, Glass Windows will shake, and Fishes are thought to be frayed with the

125.

126.

the Motion, caused by noise upon the Water. But these effects are from the local motion of the Air, which is a concomitant of the Sound (as hath been said) and not from the Sound.

127. It hath been anciently reported, and is still received, that extream applauses, and shouting of people, assembled in great multitudes, have so rarified, and broken the Air, that Birds flying over, have fallen down, the Air being not able to support them. And it is believed by some, that great Ringing of Bells in populous Cities, hath chased away Thunder; and also dissipated pestilent Air: All which may be also from the concussion of the Air, and not from the Sound.

128. A very great sound near hand, hath stricken many deaf; and at the instant they have found, as it were, the breaking of a Skin of Parchment in their Ear: And my self, standing near one that lured loud and shrill, had suddenly an offence, as if somewhat had broken, or been dislocated in my Ear, and immediately after a loud Ringing; (not an ordinary Singing, or Hissing, but far louder, and differing; so as I feared some Deafness. But after some half quarter of an hour, it vanished. This effect may be truly referred unto the Sound; for (as is commonly received) an overpotent Object doth destroy the Sense; and Spiritual Species, (both Visible and Audible,) will work upon the sensories, though they move not any other Body.

129. In *Delation of Sounds*, the enclosure of them preserveth them, and causeth them to be heard further. And we finde in Rowls of Parchment, or Truncks, the Mouth being laid to the one end of the Rowl of Parchment, or Trunck, and the Ear to the other, the Sound is heard much further then in the open Air. The cause is, for that the Sound spendeth, and is dissipated in the open Air; but in such Concaves, it is conserved and contracted. So also in a Piece of Ordnance, if you speak in the Touch-hole, and another lay his Ear to the Mouth of the Piece, the Sound passeth, and is far better heard than in the open Air.

130. It is further to be considered, how it proveth and worketh when the Sound is not enclosed, all the length of his way, but passeth partly through open Air; as where you speak some distance from a Trunck, or where the Ear is some distance from the Trunck, at the other end; or where both Mouth and Ear are distant from the Trunck. And it is tryed, that in a long Trunck of some Eight or ten foot, the sound is holpen, though both the Mouth, and the Ear be a handful or more, from the ends of the Trunck; and somewhat more holpen, when the Ear of the Hearer is near, than when the Mouth of the Speaker. And it is certain, that the Voice is better heard in a Chamber from abroad, than abroad from within the Chamber.

131. As the *Enclosure*, that is round about and entire, preserveth the Sound; so doth a Semi-concave, though in a less degree. And therefore, if you divide a Trunck, or a Cane into two, and one speak at the one end, and you lay your Ear at the other, it will carry the Voice further, than in the Air at large. Nay further, if it be not a full Semi-concave; but if you do the like upon the Mast of a Ship, or a long Pole, or a Piece of Ordnance (though one speak upon Surface of the Ordnance, and not at any of the Bores) the Voice will be heard further then in the Air at large.

132. It would be tryed, how, and with what proportion of disadvantage, the Voice will be carried in an Horn, which is a Line Arched; or in a Trumpet, which is a Line Retorted; or in some Pipe that were Sinuous.

It is certain, (howsoever it cross the received opinion) that Sounds may be created without Air, though Air be the most favorable different of Sounds. Take a Vessel of Water, and knap a pair of Tongs some depth within the Water, and you shall hear the Sound of the Tongs well, and not much diminished, and yet there is no Air at all present.

133.

Take one Vessel of Silver, and another of Wood, and fill each of them full of water, and then knap the Tongs together as before, about an handful from the bottom, and you shall finde the Sound much more resounding from the Vessel of Silver, than from that of Wood; and yet if there be no Water in the Vessel, so that you knap the Tongs in the Air, you shall finde no difference between the Silver, and the Wooden Vessel, whereby beside the main point of creating sound without Air, you may collect two things; the one, that the sound communicateth with the bottom of the Vessel; the other, that such a communication passeth far better thorow Water than Air.

134.

Strike any hard Bodies together in the midst of a flame, and you shall hear the sound with little difference, from the sound in the Air.

135.

The *Pneumatical part*, which is in all *Tangible Bodies*, and hath some affinity with the Air, performeth in some degre, the parts of the Air; as when you knock upon an empty Barrel, the sound is (in part) created by the Air on the outside, and (in part) by the Air in the inside; for the sound will be greater or lesser, as the Barrel is more empty, or more full; but yet the sound participateth also with the Spirit in the Wood, thorow which it passeth from the outside to the inside; and so it cometh to pass in the chiming of Bells on the outside, where also the sound passeth to the inside; and a number of other like instances, whereof we shall speak more when we handle the *Communication of Sounds*.

136.

It were extream grossness to think (as we have partly touched before) that the sound in Strings is made, or produced between the Hand and the String, or the Quill and the String, or the Bow and the String: For those are but *Vehicula motus*. passages to the Creation of the sound, the sound being produced between the String and the Air; and that not by any impulsion of the Air, from the first Motion of the String; but by the return or result of the String, which was strained by the touch to his former place; which Motion of Result is quick and sharp, whereas the first Motion is soft and dull. So the Bow tortureth the String continually, and thereby holdeth it in a continual Trepidation.

137.

TAke a Trunk, and let one whistle at the one end, and hold your ear at the other and you shall finde the sound strike so sharp, as you can scarce endure it. The cause is, for that sound diffuseth it self in round, and so spendeth it self: But if the sound, which would scatter in open Air, be made to go all into a *Canalo*; it must needs give greater force to the sound. And so you may note, that inclosures do not onely preserve sound, but also encrease and sharpen it.

138.

Experiments in Consort, touching the Magnitude and Exility, and Damps of Sounds.

A *Hunters Horn*, being greater at one end, than at the other, doth encrease the sound more, than if the Horn were all of an equal bore. The cause is, for that the Air and Sound, being first contracted at the lesser end, and afterwards having more room to spread at the greater end, do dilate themselves, and in coming out, strike more Air, whereby the sound is the greater, and baser. And even *Hunters Horns*, which are sometimes

139.

made straight, and not oblick, are ever greater at the lower end. It would be tryed also in Pipes, being made far larger at the lower end, or being made with a Belly towards the lower end, and then issuing into a straight concave again.

140. There is in *St. Jameses Fields*, a Conduit of Brick, unto which joyneth a low Vault; and at the end of that, a round House of Stone; and in the Brick Conduit there is a Window, and in the round House a Slit or Rift of some little breadth; if you cry out in the Rift, it will make a fearful roaring at the Window. The cause is the same with the former: For that all Concaves that proceed from more narrow to more broad, do amplify the Sound at the coming out.

141. *Hawks Bells* that have holes in the sides, give a greater ring, than if the Pellet did strike upon Brass in the open Air. The cause is the same with the first instance of the Trunck: Namely, for that the Sound, enclosed with the sides of the Bell, cometh forth at the holes unspent and more strong.

142. In *Drums*, the closeness round about, that preserveth the Sound from dispersing, maketh the noise come forth at the Drum-hole, far more loud and strong, than if you should strike upon the like skin, extended in the open Air. The cause is the same with the two precedent.

143. Sounds are better heard, and further off in an Evening, or in the Night, than at the Noon or in the Day. The cause is, for that in the Day, when the Air is more thin (no doubt) the Sound pierceth better; but when the Air is more thick (as in the Night) the Sound spendeth and spreadeth abroad less; and so it is a degree of Enclosure. As for the night, it is true also, that the general silence helpeth.

144. There be two kindes of *Reflections of Sounds*; the one at Distance, which is the Echo; wherein the original is heard distinctly, and the Reflexion also distinctly; of which, we shall speak hereafter. The other in Concurrency; when the Sound reflecting (the Reflexion being near at hand) returneth immediately upon the original, and so iterateth it not, but amplifieth it. Therefore we see, that Musick upon the Water soundeth more; and so likewise, Musick is better in Chambers Wainscotted than Hanged.

145. The Strings of a *Lute*, or *Viol*, or *Virginals*, do give a far greater Sound, by reason of the Knot, and Board, and Concave underneath, than if there were nothing but onely the Flat of a Board, without that Hollow and Knot, to let in the upper Air into the lower. The cause is, the Communication of the upper Air with the lower, and penning of both from expence or dispersing.

146. An *Irish Harp* hath open Air on both sides of the Strings; and it hath the Concave or Belly, not a long the Strings, but at the end of the Strings. It maketh a more resounding Sound, than a *Bandora*, *Orpharion*, or *Cittern*, which have likewise Wire-strings. I judge the cause to be, for that open Air on both sides helpeth, so that there be a Concave; which is therefore best placed at the end.

147. In a *Virginal*, when the Lid is down, it maketh a more exile Sound than when the Lid is open. The cause is, for that all shutting in of Air, where there is no competent Vent, dampeth the Sound; which maintaineth likewise the former instance: For the Belly of the *Lute*, or *Viol*, doth pen the Air somewhat.

There is a Church at *Glocester*, (and as I have heard, the like is in some other places) where if you speak against a Wall softly, another shall hear your voice better a good way off, than near hand. Inquire more particularly of the fame of that place. I suppose there is some Vault, or Hollow, or Ile, behinde the Wall, and some passage to it, towards the further end of that Wall against which you speak: So as the voice of him that speaketh slideth along the Wall, and then entreth at some passage, and communicateth with the Air of the Hollow; for it is preserved somewhat by the plain Wall; but that is too weak to give a Sound audible, till it hath communicated with the back Air.

148.

Strike upon a Bow-string, and lay the Horn of the Bow near your Ear, and it will increase the Sound, and make a degree of a Tone. The cause is for that the sensory, by reason of the close holding is percussed, before the Air disperleth. The like is, if you hold the Horn betwixt your Teeth. But that is a plain *Dilation* of the Sound, from the Teeth to the *Instrument of Hearing*; for there is a great intercourse between those two parts, as appeareth by this, that a harsh grating Tune setteth the Teeth one edge. The like falleth out, if the Horn of the Bow be put upon the Temples; but that is but the slide of the Sound from thence to the ear.

149.

If you take a Rod of Iron or Brass, and hold the one end to your ear and strike upon the other, it maketh a far greater Sound, than the like stroke upon the Rod, not made so contiguous to the Ear. By which, and by some other instances that have been partly touched, it should appear; that Sounds do not onely slide upon the surface of a smooth Body, but do also communicate with the Spirits that are in the Pores of the Body.

150.

I remember in *Trinity-Colledge* in *Cambridge*, there was an upper Chamber, which being thought weak in the Roof of it, was supported by a Pillar of Iron, of the bigness of ones arm, in the midst of the Chamber, which, if you had struck, it would make a little flat noise in the Room where it was struck; but it would make a great bomb in the Chamber beneath.

151.

The sound which is made by Buckets in a Well, when they touch upon the Water, or when they strike upon the side of the Well, or when two Buckets dash the one against the other. These Sounds are deeper and fuller, than if the like Percussion were made in the open Air. The cause is the penning and enclosure of the Air in the Concave of the Well.

152.

Barrels placed in a Room under the Floor of a Chamber, make all noises in the same Chamber more full and resounding.

153.

So that there be five ways (in general) of *Majoration of Sounds*, *Enclosure Simple*, *Enclosure in the Dilatation*, *Communication*, *Reflexion*, *Concurrent*, and *Approach to the Sensory*.

For Exility of the Voice, or other Sounds: It is certain, that the Voice doth pass thorow solid and hard Bodies, if they be not too thick; and thorow Water, which is likewise a very close Body, and such an one as letteth not in Air. But then the Voice or other Sound is reduced, by such passage to a great weakness or exility. If therefore you stop the Holes of a *Hawks Bell*, it will make no ring, but a flat noise or rattle. And so doth the *Aeties* or *Eagles Stone*, which hath a little stone within it.

154.

And as for Water, it is a certain Tryal: Let a mango into a Bath, and take a Pail and turn the bottom upward; and carry the mouth of it (even) down to the level of the Water, and so press it down under the Water some handfull and an half, still keeping it even, that it may not tilt on either side, and so the Air get out: Then let him that is in the Bath, dive

155.

with his head so far under Water, as he may put his head into the Pail, and there will come as much Air bubbling forth, as will make room for his head. Then let him speak, and any that shall stand without, shall hear his voice plainly, but yet made extream sharp and exile, like the voice of Puppets: But yet the Articulate Sounds of the words will not be confounded. Note, that it may be much more handsomly done, if the Pail be put over the Mans head above Water, and then he cower down, and the Pail be pressed down with him. Note, that a man must kneel or sit, that he may be lower than the Water. A man would think, that the *Sicilian* Poet had knowledge of this Experiment; for he saith, that *Hercules's* Page *Hylas* went with a Water-pot, to fill it at a pleasant Fountain that was near the shore, and that the Nymphs of the Fountain fell in love with the Boy, and pulled him under the Water, keeping him alive; and that *Hercules* missing his Page, called him by his name aloud, that all the shore rang of it; and that *Hylas* from within the Water answered his Master; but (that which is to the present purpose) with so small and exile a voice, as *Hercules* thought he had been three miles off, when the Fountain (indeed) was fast by.

156. In *Lutes* and Instruments of Strings, if you stop a string high, whereby it hath less scope to tremble, the Sound is more Trebble, but yet more dead.
157. Take two Sawcers, and strike the edge of the one against the bottom of the other, within a Pail of Water, and you shall finde that as you put the Sawcers lower and lower, the Sound groweth more flat, even while part of the Sawcer is above the Water; but that flatness of Sound is joyned with a harshness of Sound, which, no doubt, is caused by the inequality of the Sound, which cometh from the part of the Sawcer under the Water, and from the part above. But when the Sawcer is wholly under the Water, the sound becometh more clear, but far more low, and as if the sound came from a far off.
158. A soft body dampeth the sound, much more than a hard; and if a Bell hath cloth or silk wrapped about it, it deadeth the sound more than if it were Wood. And therefore in *Clericals*, the *Keyes* are lined, and in *Colledges* they use to line the *Table-men*.
159. Tryal was made in a *Recorder* after these several manners. The bottom of it was set against the Palm of the Hand, stopped with Wax round about, set against a *Damask* Cushion, thrust into Sand, into Ashes, into Water, (half an inch under the Water) close to the bottom of a *Silver* Basin, and still the *Tone* remained: But the bottom of it was set against a *Woollen* Carpet, a *Lining* of *Plush*, a *Lock* of *Wool*, (though loosely put in;) against *Snow*, and the sound of it was quite deaded, and but breath.
160. Iron hot produceth not so full a sound, as when it is cold; for while it is hot, it appeareth to be more soft, and less resounding. So likewise warm Water, when it faileth maketh not so full a sound as cold; and I conceive it is softer, and nearer the nature of *Oyl*; for it is more slippery, as may be perceived, in that it scowreth better.
161. Let there be a *Recorder* made with two *Fipples* at each end one; the *Trunck* of it of the length of two *Recorders*, and the holes answerable towards each end, and let two play the same *Lesson* upon it, at an *Unison*; and let it be noted, whether the sound be confounded, or amplified, or dulled. So likewise let a *Cross* be made of two *Truncks* (thorowout) hollow,

hollow; and let two speak or sing, the one long ways the other traverse. And let two hear at the opposite ends; and note, whether the Sound be confounded, amplified, or dulled. Which two instances will also give light to the mixture of Sounds, whereof we shall speak hereafter.

A *Bellows*, blown into the hole of a Drum, and the Drum then stricken, maketh the Sound a little flatter, but no other apparent alteration. The cause is manifest; partly for that it hindreth the issue of the Sound; and partly for that it maketh the Air being blown together, less moveable.

THE Loudness and Softness of Sounds, is a thing distinct from the Magnitude and Exility of Sounds; for a *Base-string*, though softly stricken, giveth the greater Sound; but a *Treble-string*, if hard stricken, will be heard much further off. And the cause is, for that the *Base-string* striketh more Air; and the *Treble* less Air, but with a sharper percussion.

It is therefore the strength of the Percussion, that is a principal cause of the loudness or softness of Sounds: As in knocking, harder or softer; Winding of a Horn, stronger or weaker; Ringing of an Hand bell, harder or softer, &c. And the strength of this Percussion consisteth, as much or more, in the hardness of the Body percussed, as in the force of the Body percussing: For if you strike against a Cloth, it will give a less sound; if against Wood, a greater; if against a Metal, yet a greater; and in Metals, if you strike against Gold, (which is the more pliant) it giveth the flatter sound; if against Silver or Brass, the more ringing sound. As for Air, where it is strongly pent, it matcheth a hard Body. And therefore we see in discharging of a piece, what a great noise it maketh. We see also, that the Charge with Bullet, or with Paper wet, and hard stopped; or with Powder alone rammed in hard, maketh no great difference in the loudness of the report.

The sharpness or quickness of the Percussion, is a great cause of the loudness, as well as the strength: As in a Whip or Wand, if you strike the Air with it, the sharper and quicker you strike it, the louder sound it giveth. And in playing upon the Lute or Virginals, the quick stroke or touch is a great life to the Sound. The cause is, for that the quick striking cutteth the Air speedily, whereas the soft striking, doth rather beat than cut.

THE Communication of Sounds (as in Bellies of Lutes, empty Vessels, &c.) hath been touched obiter, in the *Majoration of Sounds*: But it is fit also to make a Title of it apart.

The Experiment, for greatest Demonstration of Communication of Sounds, is the Chiming of Bells; where, if you strike with a Hammar upon the upper part, and then upon the midst, and then upon the lower, you shall finde the sound to be more Treble, and more Base, according unto the Concave on the inside, though the Percussion be onely on the outside.

When the Sound is created between the Blast of the Mouth, and the Air of the Pipe, it hath nevertheless some communication with the matter of the sides of the Pipe, and the spirits in them contained: For in a Pipe or Trumpet of Wood and Brass, the sound will be diverse; so if the Pipe be covered

166.

167.

with Cloth or Silk, it will give a diverse Sound from that it would do of it self ; so if the Pipe be a little wet on the inside, it will make a differing Sound, from the same Pipe dry.

168.

That Sound made within Water, doth communicate better with a hard Body thorow Water, than made in Air, it doth with Air. *Vide Experimentum, 134.*

Experiments
in Consort,
touching
Equality and
Inequality of
Sounds.

WE have spoken before (in the Inquisition touching *Musick*) of *Musical Sounds*, whereunto there may be a Concord or Discord in two Parts ; which *Sounds* we call *Tones*, and likewise of *Immusical Sounds* ; and have given the cause, that the *Tone* proceedeth of Equality, and the other of Inequality. And we have also expressed there, what are the Equal Bodies that give *Tones*, and what are the Unequal that give none. But now we shall speak of such Inequality of Sounds, as proceedeth not from the Nature of the Bodies themselves, but is accidental, Either from the Roughness or Obliquity of the Passage, or from the Doubling of the Percutient, or from the Trepidation of the Motion.

169.

A Bell if it have a Rift in it, whereby the sound hath not a clear passage, giveth a hoarse and jarring sound ; so the Voice of Man, when by cold taken, the *Wesil* groweth rugged, and (as we call it) furred, becometh hoarse. And in these two instances, the Sounds are ingrate, because they are meerly unequal ; but if they be unequal in equality, then the Sound is Grateful, but Purling.

170.

All *Instruments* that have either Returns, as *Trumpets* ; or *Flexions*, as *Cornets* ; or are drawn up, and put from, as *Sackbuts*, have a Purling Sound ; But the *Recorder* or *Flute* that have none of these Inequalities, give a clear Sound. Nevertheless, the *Recorder* it self or *Pipe*, moistened a little in the inside, soundeth more solemnly, and with a little Purling or Hissing. Again, a *Wreathed String*, such as are in the *Base Strings* of *Bandoraes*, giveth also a Purling Sound.

171.

Let a *Lute-string*, if it be meerly unequal in his parts, giveth a harsh and untuneable Sound, which strings we call *false*, being bigger in one place, than in another ; and therefore *Wire-strings* are never false. We see also, that when we try a false *Lute-string*, we use to extend it hard between the *Fingers*, and to flipp it ; and if it giveth a double species, it is true ; but if it giveth a trebble or more, it is false.

172.

Waters, in the noise they make as they run, represent to the Ear a trembling noise ; and in *Regals* (where they have a *Pipe*, they call the *Nightingale-Pipe*, which containeth *Water*) the Sound hath a continual trembling. And *Children* have also little things they call *Cocks*, which have water in them ; and when they blow, or whistle in them, they yield a trembling noise ; which Trembling of *Water*, hath an affinity with the *Letter L*. All which Inequalities of Trepidation, are rather pleasant, than otherwise.

173.

All *Base Notes*, or very *Treble Notes*, give an *Asper* Sound ; for that the *Base* striketh more *Air*, than it can well strike equally ; and the *Treble* cutteth the *Air* so sharp, as it returneth too swift, to make the Sound equal ; and therefore a *Mean* or *Tenor* is the sweetest part.

174.

We know nothing, that can at pleasure make a *Musical* or *Immusical Sound*, by voluntary Motion, but the *Voice* of *Man* and *Birds*. The cause is (no doubt) in the *Wesil* or *Wind-Pipe*, (which we call *Asperia Arteria*),
which

which being well extended, gathered equality; as a Bladder that is wrinkled, if it be extended, becometh smooth. The extension is always, more in Tones, than in Speech; therefore the inward voice or whisper, can never give a Tone. And in singing, there is (manifestly) a greater working and labor of the Throat, than in speaking; as appeareth in the thrusting out, or drawing in of the Chin, when we sing.

The *Humming of Bees* is an unequal buzzing, and is conceived by some of the Ancients, not to come forth at their Mouth, but to be an inward Sound; but (it may be) it is neither, but from the motion of their Wings; for it is not heard, but when they stir.

All Metals quenched in Water, give a sibilation or hissing sound (which hath an affinity with the Letter Z.) notwithstanding the Sound be created between the Water or Vapor, and the Air. Seething also, if there be but small store of Water in a Vessel, giveth a hissing sound; but boyling in a full Vessel, giveth a bubbling sound, drawing somewhat near to the Cocks used by Children.

Tryal would be made, whether the *Inequality*, or interchange of the *Medium*, will not produce an Inequality of Sound; as if three Bells were made one within another, and Air betwixt each; and then the outermost Bell were chimed with a Hammer, how the Sound would differ from a simple Bell. So likewise take a Plate of Brass, and a Plank of Wood, and joyn them close together, and knock upon one of them, and see if they do not give an unequal Sound. So make two or three Partitions of Wood in a Hoghead, with holes or knots in them; and mark the difference of their sound, from the sound of an Hoghead, without such partitions.

IT is evident, that the Percussion of the greater quantity of Air, causeth the baser Sound; and the less quantity, the more trebble Sound. The Percussion of the greater quantity of Air, is produced by the greatness of the Body percussing; by the Latitude of the Concave, by which the Sound passeth, and by the Longitude of the same Concave. Therefore we see, that a Base-string is greater than a Trebble; a Base-pipe hath a greater bore than a Trebble: And in Pipes, and the like, the lower the Note holes be, and the further off from the Mouth of the Pipe, the more Base sound they yield; and the nearer the Mouth, the more Trebble. Nay more, if you strike an entire Body, as an Anvil of Brass, at the top it maketh a more Trebble sound, and at the bottom a Baser.

It is also evident, that the sharper or quicker Percussion of Air, causeth the more Trebble sound; and the slower or heavier, the more Base sound. So we see in Strings, the more they are wound up and strained (and thereby give a more quick start back) the more Trebble is the sound; and the slacker they are, or less wound up, the Baser is the sound. And therefore a bigger String more strained, and a lesser String less strained, may fall into the same Tone.

Children, Women, Eunuchs, have more small and shrill Voices than Men. The reason is, not for that Men have greater heat, which may make the voice stronger, (for the strength of a Voice or Sound, doth make a difference in the loudness or softness, but not in the Tone) but from the dilatation of the Organ, which (it is true) is likewise caused by heat; but the cause of changing the voice at the years of puberty, is most obscure. It seemeth to be for that, when much of the moisture of the Body, which did before irrogate the

175.

176.

178.

Experiments in Consort, touching the more Trebbles, and the more Base Tones or Muscal Sounds.

179.

180.

the Parts, is drawn down to the Spermatical Vessels, it leaveth the Body more hot than it was; whence cometh the dilatation of the Pipes: For we see plainly all effects of Heat do then come on; as Pilosity, more roughness of the skin, hardness of the flesh, &c.

181. The industry of the *Musitian*, hath produced two other means of *Straining*, or *Intension of Strings*, besides their *Winding up*. The one is the *Stopping* of the *String* with the *Finger*; as in the Necks of Lutes, Viols, &c. The other is the *Shornness* of the *String*; as in Harps, Virginals, &c. Both these have one and the same reason, for they cause the *String* to give a quicker start.

182. In the straining of a String, the further it is strained, the less superstraining goeth to a Note: For it requireth good winding of a String, before it will make any Note at all. And in the stops of Lutes, &c. the higher they go, the less distance is between the Frets.

183. If you fill a *Drinking Glass* with Water, (especially one sharp below, and wide above) and fillip upon the Brim, or outside; and after, empty part of the Water, and so more and more, and still try the Tone by fillipping; you shall finde the Tone fall, and be more Bate as the Glass is more empty.

Experiments
in Consort,
touching the
Proportion of
Trebble and
Base Tones.

THe just and measured Proportion of the Air percussed, towards the Baseness or Trebleness of Tones, is one of the greatest secrets in the Contemplation of Sounds. For it discovereth the true Coincidence of Tones into Diapasons, which is the return of the same Sound. And so of the Concords and Discords, between the Unison and Diapason; which we have touched before in the *Experiments of Musick*, but think fit to resume it here as a principal part of our Inquiry, touching the *Nature of Sounds*. It may be found out in the Proportion of the Winding of Strings, in the Proportion of the Distance of Frets, and in the Proportion of the Concave of Pipes, &c. But most commodiously in the last of these.

184. Try therefore the Winding of a String once about, as soon as it is brought to that extension as will give a Tone, and then of twice about, and thrice about, &c. And mark the scale or difference of the Rice of the Tone, whereby you shall discover in one, two effects; both the proportion of the Sound towards the Dimension of the Winding, and the proportion likewise of the Sound towards the String, as it is more or less strained. But note that to measure this, the way will be to take the length in a right line of the String, upon any Winding about of the Peg.

185. As for the Stops, you are to take the number of Frets, and principally the length of the Line, from the first stop of the String, unto such a stop as shall produce a *Diapason* to the former stop, upon the same String.

186. But it will best (as it is said) appear in the *Bores of Wind-Instruments*; and therefore cause some half dozen Pipes to be made in length, and all things else a like, with a single double, and so one to a sextuple Bore; and so mark what fall of Tone every one giveth. But still in these three last instances you must diligently observe, what length of String, or distance of Stop, or concave of Air, maketh what rise of Sound. As in the last of these (which, as we said, is that which giveth the aptest demonstration) you must set down what increase of Concave goeth to the making of a Note higher, and what of two Notes, and what of three Notes, and so up to the Diapason: For then the great secret of Numbers and Proportions will appear. It is not unlikely,

unlikely, that those that make Recorders, &c. know this already; for that they make them in Sets. And likewise Bell-Founders in fitting the tune of their Bells: So that enquiry may save tryal. Surely, it hath been observed by one of the Ancients, that an empty Barrel knocked upon with the finger, giveth a Diapason to the Sound of the like Barrel full: But how that should be, I do not well understand, for that the knocking of a Barrel full or empty, doth scarce give any Tone.

There is required some sensible difference in the Proportion of creating a Note towards the Sound it self, which is the Passive; and that it be not too near, but at a distance: For in a Recorder, the three uppermost holes yield one Tone; which is a Note lower than the Tone of the first three. And the like (no doubt) is required in the winding or stopping of Strings.

THERE is another difference of Sounds, which we will call *Exterior* and *Interior*. It is not Soft nor Loud; nor it is not Base, nor Treble; nor it is not *Musical*, nor *Immusical*. Though it be true, that there can be no Tone in an *Interior Sound*; but on the other side, in an *Exterior Sound*, there may be both *Musical* and *Immusical*. We shall therefore enumerate them, rather than precisely distinguish them; though to make some adumbration of (that we mean) the Interior, is rather an Impulsion or Contusion of the Air, than an *Elyfion* or *Section* of the same; so as the Percussion of the one towards the other, differeth as a Blow differeth from a Cut.

In Speech of Man, the Whispering, (which they call *Susurrus* in Latin,) whether it be louder or softer, is an Interior Sound; but the Speaking out, is an Exterior Sound: And therefore you can never make a Tone, nor sing in Whispering; but in Speech you may. So Breathing, or Blowing by the Mouth, Bellows, or Wind (though loud) is an Interior Sound; but the blowing thorow a Pipe, or Concave (though soft) is an Exterior. So likewise, the greatest Winds, if they have no coarctation, or blow not hollow, give any Interior Sound; the whistling or hollow Wind, yieldeth a singing, or Exterior Sound; the former being pent by some other Body, the latter being pent in by his own Density: And therefore we see, That when the Wind bloweth hollow, it is a sign of Rain; the flame, as it moveth within it self, or is blown by a Bellows, giveth a murmur or Interior Sound.

There is no hard Body, but struck against another hard Body, will yield an Exterior Sound, greater or lesser; insomuch, as if the Percussion be over-soft, it may induce a nullity of sound, but never an Interior Sound; as when one treadeth so softly, that he is not heard.

Where the Air is the Percutient, pent or not pent, against a hard Body, it never giveth an Exterior Sound; as if you blow strongly with a Bellows against a Wall.

Sounds (both Exterior and Interior) may be made as well by Suction, as by emission of the Breath; as in Whistling, or Breathing.

IT is evident, and it is one of the strangest secrets in Sounds; that the whole Sound is not in the whole Air onely, but the whole Sound is also in every small part of the Air. So that all the curious diversity of Articulate

of Sounds.*

culate sounds of the voice of Man or Birds, will enter into a small crany, inconfused.

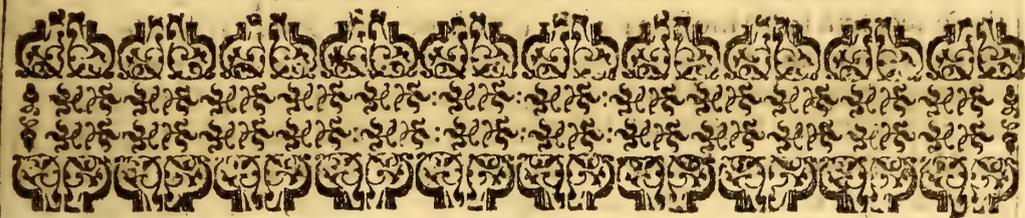

193. The unequal agitation of the *Winds*, and the like, though they be material to the carriage of the Sounds, further or less way; yet they do not confound the Articulation of them at all, within that distance that they can be heard, though it may be, they make them to be heard less way, than in a still, as hath been partly touched.
194. Over-great distance confoundeth the Articulation of Sounds, as we see, that you may hear the sound of a Preachers voice, or the like, when you cannot distinguish what he saith. And one Articulate sound will confound another, as when many speak at once.
195. In the Experiment of speaking under VVater, when the voice is reduced to such an extream exibility, yet the Articulate sounds (which are the words) are not confounded, as hath been said.
196. I conceive that an extream small, or an extream great sound, cannot be Articulate, but that the Articulation requireth a mediocrity of sound: For that the extream small sound confoundeth the Articulation by contracting, and the great sound by dispersing; and although (as was formerly said) a Sound Articulate, already created, will be contracted into a small crany; yet the first Articulation requireth more dimension.
197. It hath been observed, that in a Room, or in a Chappel, Vaulted below, and Vaulted likewise in the Roof, a Preacher cannot be heard so well, as in the like places not so Vaulted. The cause is, for that the subsequent words come on, before the precedent words vanish; and therefore the Articulate Sounds are more confused, though the gross of the Sound be greater.
198. The motions of the *Tongue, Lips, Throat, Palate, &c.* which go to the making of the several *Alphabetical Letters* are worthy inquiry, and pertinent to the present Inquisition of Sounds: But because they are subtil and long to describe, we will refer them over, and place them amongst the *Experiments of Speech*. The *Hebrews* have been diligent in it, and have assigned which Letters are *Labial*, which *Dental*, which *Guttural, &c.* As for the *Latins* and *Grecians*, they have distinguished between *Semi-vowels* and *Mutes*; and in *Mutes*, between *Mute Tenuis, Media* and *Aspirata*, not amiss, but yet not diligently enough. For the special strokes and motions that create those Sounds, they have little enquired; as that the Letters, *B. P. F. M.* are not expressed, but with the contracting, or shutting of the Mouth; that the Letters *N.* and *B.* cannot be pronounced, but that the Letter *N.* will turn into *M.* as *Hecatonba* will be *Hecatomba*. That *M.* and *T.* cannot be pronounced together, but *P.* will come between; as *Emtus*, is pronounced *Empius*, and a number of the like: So that if you enquire to the full, you will finde, that to the making of the whole Alphabet, there will be fewer simple Motions required, than there are Letters.
199. The Lungs are the most spongy part of the Body, and therefore ablest to contract and dilate it self; and where it contracteth it self, it expelleth the Air, which thorow the *Arine, Throat, and Mouth*, maketh the Voice: But yet Articulation is not made, but with the help of the *Tongue, Pallate*, and the rest of those they call *Instruments of Voice*.

There is found a Similitude between the Sound that is made by *Inanimate Bodies*, or by *Animate Bodies*, that have no Voice Articulate; and divers Letters of Articulate Voices; and commonly Men have given such names to those Sounds as do allude unto the Articulate Letters. As *Trembling of Water* hath resemblance with the Letter L. *Quenching of Hot Metals* with the Letter Z. *Snarling of Dogs* with the Letter R. *The Noise of Scratch-Owls* with the Letters Sh. *Voice of Cats* with the Dipthong Eu. *Voice of Chucks* with the Dipthong Ou. *Sounds of Strings* with the Letters Ng. So that if a Man (for curiosity or strangeness sake) would make a Puppet, or other dead Body, to pronounce a word: Let him consider on the one part, the Motion of the *Instruments of Voice*; and on the other part, the like Sounds made in *Inanimate Bodies*; and what Conformity there is, that causeth the Similitude of Sounds; and by that he may minister light to that effect.

THE END

NATURAL HISTORY.

Century III.

ALL Sounds (whatsoever) move round, that is to say, On all sides, Upwards, Downwards, Forwards, and Backwards: This appeareth in all Instances.

Sounds do not require to be conveighed to the Sense in a right Line, as *Visibles* do, but may be arched, though it be true they move strongest in a right Line; which nevertheles is not caused by the rightness of the Line, but by the shortness of the distance. *Linearectea brevisissima.* And therefore, we see if a Wall be between, and you speak on the one side, you hear it on the other; which is not because the sound passeth thorow the Wall, but arched over the Wall.

If the Sound be stopped and repercussed, it cometh about on the other side, in an oblick Line: So, if in a Coach, one side of the Boot be down, and the other up, and a Begger beg on the close side, you would think that he were on the open side. So likewise, if a Bell or Clock, be (for example) on the North-side of a Chamber, and the Window of that Chamber be upon the South; he that is in the Chamber, will think the sound came from the South.

Sounds, though they spread round, so that (there is an orb, or spherical Area of the Sound) yet they move strongest, and go furthest in the Fore-Lines, from the first Local Impulsion of the Air. And therefore in Preaching, you shall hear the Preachers voice better before the Pulpit than behinde it, or on the sides, though it stand open. So a *Harquebuz*, or Ordnance will be further heard forwards, from the mouth of the Piece, than backwards, or on the sides.

It may be doubted, that Sounds do move better downwards, than upwards. *Tulpis* are placed high above the people: And when the *Ancient*

202.
203.

204.

205.

Generals spake to their Armies, they had ever a Mount of Turff cast up, where upon they stood. But this may be imputed to the stops and obstacles which the voice meeteth with, when one speaketh upon the level. But there seemeth to be more in it; for it may be, that Spiritual Species, both of things visible, and Sounds, do move better downwards than upwards. It is a strange thing, that to Men standing below on the ground, those that be on the top of *Pauls*, seem much less than they are, and cannot be known: But to Men above those below, seem nothing so much lessened, and may be known; yet it is true, That all things to them above, seem also somewhat contracted and better collected into figure; as Knots in Gardens shew best from an upper Window or Tartas.

206.

But to make an exact tryal of it, let a Man stand in a Chamber, not much above the Ground, and speak out at the Window thorow a Trunck, to one standing on the Ground as softly as he can, the other laying his Ear close to the Trunck: Then *Via versa*, let the other speak below keeping the same proportion of softness; and let him in the Chamber lay his Ear to the Trunck. And this may be the aptest means to make a Judgment, whether Sounds descend or ascend better.

207.

Experiments
in Consort,
touching the
Lasting and
Perishing of
Sounds; and
touching the
time they re-
quire to the
Generation or
Dclasion.

After that *Sound* is created (which is in a moment) we finde it continueth some small time, melting by little and little. In this there is a wonderful error amongst Men, who take this to be a continuance of the first Sound; whereas (in truth) it is a Renovation, and not a Continuance: For the Body percussed, hath by reason of the Percussion, a Tripidation wrought in the minute parts, and so reneweth the Percussion of the Air. This appeareth manifestly, because that the Melting sound of a Bell, or of a string stricken, which is thought to be a Continuance, ceaseth as soon as the Bell or string are touched. As in a Virginal, as soon as ever the Jack falleth, and toucheth the string, the sound ceaseth; and in a Bell, after you have chimed upon it, if you touch the Bell, the sound ceaseth. And in this you must distinguish, that there are two Trepidations, The one Manifest and Local; as of the Bell, when it is Penfile; the other Secret, of the Minute parts, such as is described in the ninth Instance. But it is true, that the Local helpeth the Secret greatly. We see likewise, that in Pipes, and other Wind Instruments, the sound lasteth no longer than the breath bloweth. It is true, that in Organs there is a confused murmur for a while, after you have played, but that is but while the Bellows are in falling.

208.

It is certain, that in the noise of great Ordnance, where many are shot off together, the sound will be carried (at the least) twenty miles upon the Land, and much further upon the Water, but then it will come to the Ear; not in the instant of the shooting off, but it will come an hour, or more later; This must needs be a Continuance of the first Sound; for there is no Trepidation which should renew it. And the touching of the Ordnance would not extinguish the sound the sooner: So that in great Sounds, the Continuance is more than Momentany.

209.

To try exactly the time wherein Sound is delated, Let a Man stand in a Steeple, and have with him a Taper, and let some Veil be put before the Taper, and let another Man stand in the Field a mile off; then let him in the Steeple strike the Bell, and in the same instant withdraw the Veil, and so let him in the Field tell by his Pulse, what distance of time there is between the Light seen, and the Sound heard: For it is certain, That the Delation of

Light

Light is in an instant. This may be tried in far greater distances, allowing greater Lights and Sounds.

It is generally known and observed, that Light and the object of Sight, move swifter than Sound; for we see the flash of a piece is seen sooner, than the noise is heard. And in hewing Wood, if one some distance off, he shall see the Arm lifted up for a second stroke, before he hear the noise of the first; and the greater the distance, the greater is the prevention: As we see in Thunder, which is far off, where the *Lighning* precedeth the crack a good space.

Colours, when they represent themselves to the Eye, fade not nor melt not by degrees, but appear still in the same strength; but Sounds melt, and vanish, by little and little. The cause is, for that Colours participate nothing with the motion of the Air, but Sounds do. And it is a plain argument that Sound participateth of some Local Motion of the Air, (as a cause *Sine qua non*) in that it perisheth so suddenly: For in every Section, or Impulsion of the Air, the Air doth suddenly restore and reunite it self, which the Water also doth, but nothing so swiftly.

IN the Tryals of the Passage, or not Passage of Sounds, you must take heed you mistake not the passing by the sides of a Body, for the passing thorow a Body; and therefore you must make the Intercepting Body very close; for Sound will pass thorow a small chink.

Where Sound passeth thorow a hard, or close Body (as thorow Water, thorow a Wall, thorow Metal, as in Hawks Bells stopped, &c.) the hard or close Body, must be but thin and small; for else it deadeth and extinguisheth the Sound utterly. And therefore, in the Experiment of Speaking in Air under Water, the voice must not be very deep within the Water, for then the Sound pierceth not. So if you speak on the further side of a close Wall, if the Wall be very thick, you shall not be heard; and if there were an Hogs-head empty, whereof the sides were some two foot thick, and the Bung-hole stopped. I conceive, the resounding sound by the Communication of the outward Air with the Air within, would be little or none, but onely you shall hear the noise of the outward knock, as if the Vessel were full.

It is certain, that in the passage of Sounds thorow hard Bodies, the Spirit or Pneumatical part of the hard Body it self doth co-operate; but much better, when the sides of that hard Body are struck, than when the percussion is onely within, without touch of the sides. Take therefore a Hawks-Bell, the holes stopped up, and hang it by a thred within a Bottle-Glass, and stop the Mouth of the Glass very close with Wax, and then shake the Glass, and see whether the Bell give any sound at all, or how weak? But note, that you must instead of Thred take a Wire, or else let the Glass have a great Belly, lest when you shake the Bell, it dash upon the sides of the Glass.

It is plain that a very long and down right arch for the Sound to pass, will extinguish the Sound quite, so that that Sound, which would be heard over a Wall, will not be heard over a Church; nor that Sound, which will be heard, if you stand some distance from the VWall, will be heard if you stand close under the VWall.

Soft and Foraminous Bodies in the first creation of the Sound, will dead it; for the striking against Cloth or Fur, will make little sound, as hath been said: But in the passage of the sound, they will admit it better than harder Bodies, as we see, that Curtains and Hangings will not stay the sound much; but Glass windows, if they be very close, will check a sound more, than the like thickness of Cloth. VVe see also in the rumbling of the Belly, how easily the Sound passeth thorow the Guts and Skin.

210.

211.

Experiments in Confort, touching the Passage and Interceptions of Sounds.

212.

213.

214.

215.

216.

It is worthy the inquiry, whether great Sounds (as of Ordnance or Bells) become not more Weak and Exile, when they pass thorow small Cranies. For the Subtilties of Articulate Sounds, (it may be) may pass thorow small Cranies, not confused ; but the magnitude of the Sound (perhaps) not so well.

217.

Experiments
in Consort,
touching the
Medium of
Sounds.

THe *Mediums* of Sounds, are Air, soft and porous Bodies; also Water, and hard Bodies refuse not altogether to be *Mediums of Sounds*. But all of them are dull and unapt different, except the Air.

218

In Air, the thinner or drier Air, carrieth not the Sound so well, as the more dense; as appeareth in Night Sounds, and Evening Sounds, and Sounds in moist Weather, and Southern Winds. The reason is already mentioned in the Title of *Majoration of Sounds*; being, for that thin Air is better pierced, but thick Air preserveth the Sound better from waste: Let further Tryal be made by hollowing in Mists, and gentle Showers; for (it may be) that will somewhat dead the Sound.

219.

How far forth Flame may be a *Medium of Sounds*, (especially of such Sounds as are created by Air, and not betwixt hard Bodies) let it be tried in speaking, where a Bonfire is between; but then you must allow for some disturbance, the noise that the Flame it self maketh.

220.

Whether any other Liquors being made *Mediums*, cause a diversity of Sound from Water, it may be tryed: As by the knapping of the Tongs, or striking the bottom of a Vessel filled either with Milk or with Oyl; which though they be more light, yet are they more unequal Bodies than Air.

Of the Natures of the Mediums, we have now spoken; as for the Disposition of the said Mediums, it doth consist in the Penning, or not Penning of the Air; of which, we have spoken before in the Title of Delation of Sounds. It consisteth also in the Figure of the Concave, through which it passeth. Of which, we will speak next.

Experiments
in Consort,
what the Fi-
gures of the
Pipes or Con-
caves, or the
Bodies differ-
ent, conduce
to the Sounds.

HOW the *Figures of Pipes or Concaves*, through which Sounds pass, or of other *Bodies* different; conduce to the variety and alteration of the Sounds, either in respect of the greater quantity, or less quantity of Air, which the *Concaves* receive; or in respect of the carrying of Sounds longer or shorter way; or in respect of many other Circumstances, they have been touched, as falling into other Titles. But those *Figures* which we now are to speak of, we intend to be, as they concern the Lines, through which Sound passeth: As *Straight, Crooked, Angular, Circular, &c.*

221.

The Figure of a Bell parraketh of the *Pyramid*, but yet coming off, and dilating more suddenly. The *Figure* of a *Hunters Horn*, and *Cornet*, is oblick, yet they have likewise straight Horns; which if they be of the same bore with the oblick, differ little in Sound, save that the straight require somewhat a stronger blast. The *Figure* of *Recorders*, and *Flutes*, and *Pipes*, are straight; but the *Recorder* hath a less bore, and a greater, above and below. The *Trumpet* hath the *Figure* of the *Letter S*, which maketh that Purling Sound, &c. Generally, the straight Line hath the cleanest and roundest Sound, and the crooked the more Hoarse, and Jarring.

222.

Of a Sinuous Pipe that may have some four Flexions, tryal would be made. Likewise of a Pipe made like a Cross, open in the midst; and so likewise

likewise of an *Angular Pipe*; and see what will be the effects of these several Sounds. And so again of a *Circular Pipe*: As if you take a Pipe perfect round, and make a hole whercinto you shall blow, and another hole not far from that; but with a traverse or stop between them: So that your breath may go the Round of the Circle, and come forth at the second hole. You may try likewise Percussions of solid Bodies of several Figures: As *Globes, Flats, Cubes, Crosses, Triangles, &c.* And their Combinations; as *Flat* against *Flat*, and *Convex* against *Convex*, and *Convex* against *Flat, &c.* And mark well the diversities of the Sounds. Try also the difference in sound of several Crassitudes of hard Bodies percussed, and take knowledge of the diversities of the sounds. I my self have tried, That a *Bell of Gold* yieldeth an excellent sound, not inferior to that of *Silver* or *Brass*, but rather better. Yet we see that a piece of money of *Gold*, soundeth far more flat than a piece of money of *Silver*.

The Harp hath the concave, not along the strings, but across the strings; and no *Instrument* hath the sound so melting and prolonged, as the *Irish Harp*. So as I suppose, that if a *Virginal* were made with a double Concave; the one all the length as the *Virginal* hath, the other at the end of the strings, as the *Harp* hath; it must needs make the sound perfecter, and not so shallow, and jarring. You may try it without any Sound-board along, but onely Harp-wise, at one end of the strings; or lastly, with a double concave, at each end of the strings one.

There is an apparent diversity between the *Species Visible* and *Audible*, in this. That the *Visible* doth not mingle in the *Medium*, but the *Audible* doth. For if we look abroad, we see Heaven, a number of Stars, Trees, Hills, Men, Beasts, at once; and the *Species* of the one, doth not confound the other: But if so many Sounds come from several parts, one of them would utterly confound the other. So we see, That *Voices* or *Consorts* of *Musick* do make a harmony by mixture, which *Colours* do not. It is true nevertheless, that a great light drowneeth a smaller, that it cannot be seen; as the Sun that of a *Glowworm*, as well as a great sound drowneeth a lesser. And I suppose likewise, that if there were two *Lanthorns* of *Glass*, the one a *Crimsin*, and the other an *Azure*, and a *Candle* within either of them, those coloured lights, would mingle and cast upon a *White Paper*, a *Purple* colour. And even in colours, they yield a faint and weak mixture; for *White Walls* make rooms more lightsome, than *Black, &c.* But the cause of the Confusion in Sounds, and the Inconfusion in *Species Visible*, is, For that the Sight worketh in right Lines, and maketh several *Cones*; and so there can be no Coincidence in the Eye, or *Visual Point*: But Sounds that move in oblick and arcuate Lines, must needs encounter, and disturb the one the other.

The sweetest and best Harmony is, when every Part or Instrument is not heard by it self, but a conflation of them all, which requireth to stand some distance off. Even as it is in the mixture of perfumes, or the taking of the smells of several Flowers in the Air.

The disposition of the Air, in other qualities, except it be joynd with Sound, hath no great operation upon Sounds: For whether the Air be lightsome or dark, hot or cold, quiet or stirring, (except it be with noise) sweet-smelling, or stinking, or the like; it importeth not much. Some petty alteration or difference it may make,

223.

224.
Experiments
in Consort,
touching the
Mixture of
Sounds.

225.

226.

227. But Sounds do disturb and alter the one the other: Sometimes the one drowning the other, and making it not heard; sometimes the one jarring and discording with the other, and making a confusion; sometimes the one mingling and compounding with the other, and making an harmony.

228. Two Voices of like loudness, will not be heard twice as far, as one of them alone; and two Candles of like light, will not make things seem twice as far off, as one. The cause is profound, but it seemeth, that the Impressions from the objects of the Sentes, do mingle respectively, every one with his kinde; but not in proportion, as is before demonstrated: And the reason may be, because the first impression, which is from Privative to Active, (as from Silence to Noise, or from Darknes to Light,) is a greater degree, than from less noise, to more noise, or from less light, to more light. And the reason of that again may be, For that the Air, after it hath received a charge, doth not receive a surcharge, or greater charge, with like appetite, as it doth the first charge. As for the increase of Vertue generally, what proportion it beareth to the increase of the Matter, it is a large Field, and to be handled by it self.

229.
Experiments
in Consort,
touching
Meloration of
Sounds.

ALL Reflexions Concurrent, do make Sounds greater; but if the Body that createth, either the original Sound, or the Reflexion, be clean and smooth, it maketh them sweeter. Tryal may be made of a *Lute* or *Vial*, with the Belly of polished Brass instead of Wood. We see, that even in the open Air, the *Wire-string* is sweeter than the *string of Guts*. And we see, that for Reflexion, *Water* excelleth; as in *Musick* near the *Water*, or in *Eccho's*.

230. It hath been tryed, that a *Pipe*, a little moistned on the inside, but yet so as there be no drops left, maketh a more solemn sound, than if the *Pipe* were dry; but yet with a sweet degree of *Sibilation* or *Purling*, as we touched it before in the Title of *Equality*. The cause is, for that all things porous, being superficially wet, and (as it were) between dry and wet, become a little more even and smooth; but the *Purling* (which must needs proceed of Inequality) I take to be bred between the smoothness of the inward Surface of the *Pipe* which is wet, and the rest of the *Wood* of the *Pipe*, unto which the wet cometh not, but it remaineth dry.

231. In Frosty weather, *Musick* within doors soundeth better; which may be, by reason not of the disposition of the *Air*, but of the *Wood* or *String* of the Instrument, which is made more crisp, and so more porous and hollow; and we see that *Old Lutes* sound better than *New*, for the same reason: And so do *Lute-strings* that have been kept long.

232. Sound is likewise meliorated by the mingling of open *Air* with pent *Air*: Therefore tryal may be made of a *Lute* or *Vial* with a double Belly, making another Belly with a knot over the string; yet so, as there be room enough for the strings, and room enough to play below that Belly. Tryal may be also made of an *Irish Harp*, with a concave on both sides, whereas it useth to have it but on one side. The doubt may be, lest it should make too much re-sounding, whereby one Note would overtake another.

233. If you sing in the hole of a *Drum*, it maketh the singing more sweet. And so I conceive it would, if it were a Song in Parts sung into several *Drums*; and for handsomness and strangeness sake, it would not be amiss to have a Curtain between the place where the *Drums* are, and the hearers.

234. When a sound is created in the *Wind-Instrument*, between the Breath and *Air*, yee if the sound be communicate with a more equal Body of the *Pipe*,

it meliorateth the sound. For (no doubt) there would be a differing sound in a Trumpet or Pipe of Wood, and again, in a Trumpet or Pipe of Brass. It were good to try *Recorders* and *Hunters Horns of Brass*, what the sound would be.

Sounds are meliorated by the Intension of the Sense, where the common Sense is collected most to the particular Sense of Hearing, and the Sight suspended: And therefore Sounds are sweeter, as well as greater, in the Night than in the Day; and I suppose, they are sweeter to blinde men, than to others: And it is manifest, that between sleeping and waking, (when all the Senses are bound and suspended) *Musick* is far sweeter than when one is fully waking.

IT is a thing strange in Nature, when it is attentively considered, How Children and some Birds learn to imitate Speech. They take no mark at all of the Motion of the Mouth of him that speaketh, for Birds are as well taught in the dark, as by light. The sounds of Speech are very curious and exquisite; so one would think it were a Lesson hard to learn. It is true, that it is done with time, and by little and little, and with many essays and proffers: But all this dischargeth not the wonder. It would make a Man think (though this, which we shall say, may seem exceeding strange) that there is some transmission of Spirits, and that the Spirit of the Teacher put in motion, should work with the Spirits of the Learner, a predisposition to offer to imitate, and so to perfect the imitation by degrees. But touching Operations by Transmissions of Spirits (which is one of the highest secrets in Nature) we shall speak in due place, chiefly when we come to inquire of Imagination. But as for Imitation, it is certain, That there is in Men, and other Creatures, a predisposition to imitate. We see how ready Apes and Monkeys are to imitate all motions of Man: And in the catching of Dot-trels, we see how the foolish Bird playeth the Ape in gestures: And no Man (in effect) doth accompany with others, but he learneth (ere he is aware) some Gesture, or Voice, or Fashion of the other.

In Imitation of *Sounds*, that Man should be the Teacher, is no part of the matter: For Birds will learn one of another, and there is no reward by feeding, or the like, given them for the imitation: And besides, you shall have Parrets that will not onely imitate Voices, but Laughing, Knocking, Squeaking of a Door upon the Hinges, or of a Cart wheel, and (in effect) any other noise they hear.

No Beast can imitate the Speech of Man, but Birds onely: For the Ape it self, that is so ready to imitate otherwise, attaineth not any degree of imitation of Speech. It is true, that I have known a Dog, that if one howled in his ear, he would fall a howling a great while. What should be the aptness of Birds, in comparison of Beasts, to imitate the Speech of Man, may be further inquired. We see that Beasts have those parts, which they count the *Instruments of Speech*, (as *Lips, Teeth, &c.*) liker unto Man than Birds. As for the *Neck*, by which the *Throat* passeth, we see many Beasts have it for the length, as much as Birds. What better gorge or attire Birds have, may be further inquired. The Birds that are known to be speakers, are *Parrets, Pyes, Jays, Daws*, and *Ravens*: Of which, *Parrets* have an adunck Bill, but the rest not.

But I conceive, that the aptness of Birds is not so much in the conformity of the Organs of Speech, as in their Attention. For Speech must come by Hearing and Learning; and Birds give more heed, and mark Sounds

235

236.
Experiments
in Consort,
touching the
Imitation of
Sounds,

237.

238.

239.

more

more than Beasts ; because naturally they are more delighted with them, and practise them more, as appeareth in their Singing. We see also, that those that teach Birds to sing, do keep them waking, to increase their attention. We see also, that Cock-Birds, amongst Singing-Birds, are ever the better singers, which may be, because they are more lively, and listen more.

240. *Labor and Intention to imitate Voices*, doth conduce much to *Imitation* : And therefore we see, that there be certain *Pantomimi*, that will represent the Voices of *Players* of *Interludes*, so to life, as if you see them not, you would think they were those *Players* themselves, and so the Voices of other men that they hear.

241. There have been some that could counterfeit the distance of Voices, (which is a secondary object of Hearing) in such sort ; as when they stand fast by you, you would think the Speech came from afar off, in a fearful manner. How this is done, may be further enquired ; but I see no great use of it, but for Imposture, in counterfeiting ghosts or spirits.

Experiments
in Consort,
touching the
Reflexion of
Sounds.

There be three kinds of *Reflexions of Sounds* ; a *Reflexion Concurrent*, a *Reflexion Iterant*, which we call *Eccho*, and a *Super-reflexion*, or an *Eccho* of an *Eccho*, whereof the first hath been handled in the Title of *Magnitude of Sounds*. The latter two we will now speak of.

242. The *Reflexion of Species Visible* by *Mirrors*, you may command, because passing it Right Lines, they may be guided to any point : But the *Reflexion of Sounds*, is hard to master ; because the sound filling great spaces in arched Lines, cannot be so guided. And therefore, we see there hath not been practised any means to make Artificial *Eccho's*. And no *Eccho* already known, returneth in a very narrow room.

243. The Natural *Eccho's* are made upon Walls, Woods, Rocks, Hills, and Banks : As for Waters being near, they make a *Concurrent Eccho* ; but being further off, (as upon a large River) they make an *Iterant Eccho* : For there is no difference between the *Concurrent Eccho*, and the *Iterant*, but the quickness or slowness of the return. But there is no doubt, but Water doth help the *Delation of Eccho*, as well as it helpeth the *Delation of Original Sounds*.

244. It is certain (as hath been formerly touched,) that if you speak thorow a Trunck, stopped at the further end, you shall finde a blast return upon your mouth, but no sound at all. The cause is, for that the closeness, which preserveth the original, is not able to preserve the reflected sound ; besides that, *Eccho's* are seldom created, but by loud Sounds. And therefore there is less hope of Artificial *Eccho's* in Air, pent in a narrow concave. Nevertheless it hath been tryed, that one leaning over a Well of Twenty five fathom deep, and speaking, though but softly, (yet not so soft as a whisper) the Water returned a good audible *Eccho*. It would be tryed, whether speaking in Caves, where there is no issue, save where you speak, will not yield *Eccho's* as Wells do.

245. The *Eccho* cometh as the Original Sound doth in a round orb of Air : It were good to try the creating of the *Eccho*, where the Body repercussing maketh an Angle : As against the Return of a Wall, &c. Also we see that in *Mirrors*, there is the like Angle of Incidence, from the Object to the Glass, and from the Glass to the Eye. And if you strike a Ball side-long, not full upon the Surface, the rebound will be as much the contrary way ; whether

ther there be any such resilience in Eccho's (that is, Whether a Man shall hear better, if he stand aside the Body repercussing, than if he stand where he speaketh, or any where in a right Line between) may be tried; Tryal likewise would be made, by standing nearer the place of repercussing, than he that speaketh; and again, by standing further off, than he that speaketh, and so knowledge would be taken, whether Eccho's, as well as Original Sounds, be not strongest near hand.

There be many places, where you shall hear a number of Eccho's one after another; and it is, when there is variety of *Hills* or *Woods*, some nearer, some further off: So that the return from the further, being last created, will be likewise last heard.

As the Voice goeth round, as well towards the back, as towards the front of him that speaketh; so likewise doth the Eccho, for you have many Back-eccho's to the place where you stand.

To make an Eccho that will report three, or four, or five words distinctly, it is requisite, that the Body repercussing be a good distance off: For if it be near, and yet not so near, as to make a Concurrent Eccho, it choppeth with you upon the sudden. It is requisite likewise, that the Air be not much pent: For Air, at great distance, pent, worketh the same effect with Air at large, in a small distance. And therefore in the Tryal of Speaking in the Well, though the Well was deep, the Voice came back suddenly, and would bear the report but of two words.

From Eccho's upon Eccho's, there is a rare instance thereof in a place, which I will now exactly describe. It is some Three or four Miles from *Paris*, near a Town called *Pont-Carenton*; and some Bird-bolt shot or more from the River of *Sean*. The Room is a Chappel, or small Church; the Walls all standing, both at the sides, and at the ends; two rows of Pillars after the manner of Isles of Churches, also standing; the Roof all open, not so much as any Embowment near any of the Walls left. There was against every Pillar, a stack of Billets above a Mans height, which the Watermen, that bring Wood down the *Sean*, in Stacks, and not in Boats, laid there (as it seemeth) for their ease. Speaking at the one end, I did hear it return the Voice Thirteen several times; and I have heard of others, that it would return Sixteen times; for I was there about three of the Clock in the Afternoon; and it is best, (as all other Eccho's are) in the Evening. It is manifest, that it is not Eccho's from several places, but a tossing of the Voice, as a Ball too and fro; like to Reflexions in Looking-Glasses; where if you place one Glas before, and another behinde, you shall see the Glas behinde with the Image, within the Glas before; and again, the Glas before in that: And divers such Super-Reflexions, till the *Species speciei* at last die: For it is every return weaker, and more shady. In like manner, the Voice in that Chappel, createth *Speciem speciei*, and maketh succeeding Super-Reflexions; for it melteth by degrees, and every Reflexion is weaker than the former: So that, if you speak three words, it will (perhaps) some three times report you the whole three words; and then the two latter words for sometimes, and then the last word alone for sometimes, still fading and growing weaker. And whereas in Eccho's of one return, it is much to hear Four or five words. In this Eccho of so many Returns, upon the matter, you hear above Twenty words for three.

246.

247.

248.

249.

250. The like *Eccho* upon *Eccho*, but onely with two reports, hath been observed to be, if you stand between a House and a Hill, and lure towards the Hill; for the House will give a Back *Eccho*: One taking it from the other, and the latter the weaker.
251. There are certain *Letters*, that an *Eccho* will hardly exprefs: As *S* for one, especially being principal in a word. I remember well, that when I went to the *Eccho* at *Pont-Caremon*, there was an old *Parisian* that took it to be the Work of Spirits, and of good Spirits. For (said he) call *Satan*, and the *Eccho* will not deliver back the *Devils* name: But will say, *Vai'en*, which is as much in *French*, as *Apage*, or *Avoid*. And thereby I did hap to finde, that an *Eccho* would not return *S*, being but a *Hissing* and an *Interior Sound*.
252. *Eccho's* are some more sudden, and chap again as soon as the *Voice* is delivered, as hath been partly said; others are more deliberate, that is, give more space between the *Voice* and the *Eccho*, which is caused by the *Local nearness* or distance: Some will report a longer train of words, and some a shorter: Some more loud (full as loud as the *Original*, and sometimes more loud) and some weaker and fainter.
253. Where *Eccho's* come from several parts, at the same distance they must needs make (as it were) a *Quire* of *Eccho's*, and so make the Report greater, and even a continued *Eccho*; which you shall finde in some Hills that stand encompassed, *Theatre-like*.
254. It doth not yet appear, that there is *Refraction in Sounds*, as well as in *Species Visible*. For I do not think, that if a *Sound* should pass through divers *Mediums*, as *Air*, *Cloth*, *Wood*, it would deliver the *Sound* in a differing place, from that unto which it is deferred; which is the proper effect of *Refraction*. But *Majoration*, which is also the Work of *Refraction*, appeareth plainly in *Sounds*, (as hath been handled at full) but it is not by diversity of *Mediums*.

Experiments
in Consort,
touching the
Consent and
Dissent be-
tween *Visibles*
and *Audibles*.

WE have *Obiter*, for *Demonstrations* sake, used in divers *Instances*, the *Examples* of the *Sight*, and *Things Visible*, to illustrate the *Nature* of *Sounds*. But we think good now to prosecute that *Comparison* more fully.

Consent of *Visibles* and *Audibles*.

255. Both of them spread themselves in Round, and fill a whole *Flore* or *Orb* unto certain *Limits*; and are carried a great way, and do languish and lessen by degrees, according to the *Distance* of the *Objects* from the *Sensories*.
256. Both of them have the whole *Species* in every small portion of the *Air* or *Medium*, so as the *Species* do pass through small *Cranies*, without confusion: As we see ordinarily in *Levels*, as to the *Eye*; and in *Cranies*, or *Chinks*, as to the *Sound*.
257. Both of them are of a sudden and easie *Generation* and *Delation*, and likewise perish swiftly and suddenly; as if you remove the *Light*, or touch the *Bodies* that give the *Sound*.

Both

Both of them do receive and carry exquisite, and accurate differences; as of Colours, Figures, Motions, Distances, in *Visibles*; and of Articulate Voices, Tones, Songs, and Quaverings, in *Audibles*.

258

Both of them in their Vertue and Working, do not appear to emit any Corporal Substance into their *Mediums*, or the Orb of their Vertue; neither again to rise or stir any evident Local Motion in their *Mediums* as they pass, but onely to carry certain Spiritual Species. The perfect knowledge of the cause whereof, being hitherto scarcely attained, we shall search and handle in due place.

259.

Both of them seem not to generate or produce any other effect in Nature, but such as appertaineth to their proper Objects and Senses, and are otherwise barren.

260.

But both of them in their own proper action, do work three manifest effects. The first, in that the stronger pieces drowneth the lesser: As the light of the Sun, the light of a Glowworm, the report of an Ordnance, the Voice. The second, in that an Object of surcharge or excess, destroyeth the Sense: As the light of the Sun the eye, a violent sound (near the Ear) the Hearing. The third, in that both of them will be reverberate: As in Mirrors, and in Eccho's.

261.

Neither of them doth destroy or hinder the Species of the other, although they encounter in the same *Medium*: As Light or Colour hinder not sound, nor *à contrà*.

262.

Both of them affect the Sense in Living Creatures, and yield Objects of Pleasure and Dislike; yet nevertheless, the Objects of them do also (if it be well observed) affect and work upon dead things; namely such, as have some conformity with the Organs of the two Senses: As *Visibles* work upon a *Looking-glass*, which is like the Pupil of the Eye; and *Audibles* upon the places of *Eccho*, which resemble, in some sort, the cavern and structure of the Ear.

263.

Both of them do diversly work, as they have their *Medium* diversly disposed. So a *Trembling Medium* (as *Smoke*) maketh the object seem to tremble; and *Rising or Falling Medium* (as *Winds*) maketh the Sounds to rise or fall.

264.

To both, the *Medium*, which is the most propitious and conducive, is Air; For *Glass* or *Water*, &c. are not compairable.

265.

In both of them, where the object is fine and accurate, it conduceth much to have the Sense intente, and erect; insomuch, as you contract your eye, when you would see sharply, and erect your ear, when you would hear attentively; which in Beasts that have ears moveable, is most manifest.

266.

The Beams of Light, when they are multiplied and conglomerate, generate heat; which is a different action, from the action of Sight: And the Multiplication and Conglomeration of Sounds, doth generate an extreme Rarefaction of the Air; which is an action materiate, differing from the action of Sound. If it be true (which is anciently reported) that Birds, with great shouts, have fallen down.

267.

Dissent of Visibles and Audibles.

268. **T**He *Species of Visibles*, seem to be *Emissions of Beams* from the *Object* seen, almost like *Odors*, save that they are more incorporeal; but the *Species of Audibles*, seem to participate more with *Local Motion*, like *Percussions* or *Impressions* made upon the *Air*. So that whereas all *Bodies* do seem to work in two manners, Either by the *Communication* of their *Natures*, or by the *Impressions* and *Signatures* of their *Motions*. The *Diffusion* of *Species Visible*, seemeth to participate more of the former *Operation*, and the *Species Audible* of the latter.

269. The *Species of Audibles* seem to be carried more manifestly thorow the *Air*, than the *Species of Visibles*: For (I conceive) that a contrary strong *Wind* will not much hinder the sight of *Visibles*, as it will do the hearing of *Sounds*.

270. There is one difference above all others, between *Visibles* and *Audibles*, that is the most remarkable; as that whereupon many smaller differences do depend; Namely, that *Visibles* (except *Lights*) are carried in *Right Lines*, and *Audibles* in *Arcuate Lines*. Hence it cometh to pass, that *Visibles* do not intermingle and confound one another, as hath been said before, but *Sounds* do. Hence it cometh, that the solidity of *Bodies* doth not much hinder the sight, so that the *Bodies* be clear, and the *Pores* in a *Right Line*, as in *Glass*, *Crystal*, *Diamonds*, *Water*, &c. But a thin *Scarf* or *Handkerchief*, though they be *Bodies* nothing so solid, hinder the sight: Whereas (contrariwise) these *Porous Bodies* do not much hinder the *Hearing*, but *solid Bodies* do almost stop it, or at least attenuate it. Hence also it cometh, that to the *Reflexion* of *Visibles*, small *Glasses* suffice, but to the *Reverberation* of *Audibles*, are required greater spaces, as hath likewise been said before.

271. *Visibles* are seen further off, than *Sounds* are heard; allowing nevertheless the rate of their bigness: For otherwise, a great *Sound* will be heard further off, than a small *Body* seen.

272. *Visibles* require (generally) some distance between the object, and the *Eye* to be better seen; whereas in *Audibles*, the nearer the approach of the *Sound* is to the *Sense* the better; but in this, there may be a double error. The one, because to *Seeing* there is required *Light*, and any thing that toucheth the *Pupil* of the *Eye* (ll over) excludeth the *Light*. For I have heard of a person very credible, (who himself was cured of a *Cataract* in one of his *Eyes*) that while the *Silver-needle* did work upon the sight of his *Eye*, to remove the *Film* of the *Cataract*, he never saw anything more clear or perfect, than that white *Needle*: Which (no doubt) was, because the *Needle* was lesser than the *Pupil* of the *Eye*, and so took not the light from it. The other error may be, For that the object of *Sight* doth strike upon the *Pupil* of the *Eye*, directly without any interception; whereas the *Cave* of the *Ear* doth hold off the *Sound* a little from the *Organ*: And so nevertheless there is some distance required in both.

273. *Visibles* are swifter carried to the *Sense*, than *Audibles*; as appeareth in *Thunder* and *Lightning*; *Flame*, and *Report* of a *Piece*; *Motion* of the *Air*, in hewing of *Wood*. All which have been set down heretofore, but are proper for this Title.

I conceive also, that the *Species of Audibles*, do hang longer in the Air than those of *Visibles*: For although even those of *Visibles* do hang some time, as we see in *Rings* turned, that shew like spheres. In *Lute-strings* fillipped, a *Fire-brand* carried a long, which leaveth a train of light behinde it, and in the *Twilight*, and the like: Yet I conceive that *Sounds*, stay longer because they are carried up and down with the *Wind*; and because of the distance of the time in *Ordnances* discharged, and heard twenty miles off

274.

In *Visibles* there are not found *Objects* so odious and ingrate to the *Sense*, as in *Audibles*. For foul *Sights* do rather displease, in that they excite the memory of foul things, than in the immediate *Objects*. And therefore in *Pictures*, those foul *Sights* do not much offend; but in *Audibles*, the grating of a *Saw* when it is sharpned, doth offend so much, as it setteth the *Teeth* on edge; and any of the harsh *Discords* in *Musicks*, the *Ear* doth straightways refuse.

275.

In *Visibles*, after great light, if you come suddenly into the dark, or contrariwise out of the dark into a glaring *Light*. The eye is dazled for a time, and the *Sight* confused; but whether any such effect be after great *Sounds*, or after a deeper silence may be better enquired. It is an old *Tradition*, that those that dwell near the *Cataracts* of *Nilus*, are stricken deaf: But we finde no such effect in *Cannoniers*, nor *Millers*, nor those that dwell upon *Bridges*.

276.

It seemeth, that the *Impression of Colour* is so weak, as it worketh not, but by a *Cone* of direct *Beams*, or right *Lines*, whereof the *Basis* is in the *Object* and the *Vertical* point in the *Eye*: So as there is a coradiation and conjunction of *Beams*; and those *Beams* so sent forth, yet are not of any force to beget the like borrowed or second *Beams*, except it be by *Reflexion*, whereof we speak not. For the *Beams* pass and give little tincture to that *Air* which is adjacent; which if they did, we should see *Colours* out of a right line. But as this in *Colours*, so otherwise it is in the *Body of Light*. For when there is a skreen between the *Candle* and the *Eye*, yet the light passeth to the *Paper* whereon one writeth, so that the light is seen where the body of the flame is not seen; and where any *Colour* (if it were placed where the body of the flame is) would not be seen. I judge that *Sound* is of this latter nature: For when two are placed on both sides of a *Wall*, and the voice is heard, I judge it is not onely the *original sound*, which passeth in an *Arched line*; but the *sound*, which passeth above the *Wall* in a *Right line*, begetteth the like *Motion* round about it, as the first did, though more weak.

277.

All *Concords* and *Discords* of *Musick* (no doubt) *Sympathies* and *Antipathies* of *Sounds*, and so (likewise) in that *Musick*, which we call *Broken Musick*, or *Consort Musick*; some *Consorts* of *Instruments* are sweeter than others, (a thing not sufficiently yet observed;) as the *Irish-Harp* and *Base-Vial* agree well; the *Recorder* and *Stringed Musick* agree well; *Organs* and the *Voice* agree well, &c. But the *Virginals* and the *Lute*, or the *Welsh-Harp* and *Irish-Harp*, or the *Voice* and *Pipes* alone, agree not so well; but for the *Melioration* of *Musick*, there is yet much left (in this *Point of Exquisite Consorts*) to try and enquire.

278.

Experiments in Consort, touching the Sympathy or Antipathy of Sounds, one with another.

There is a common observation, That if a *Lute* or *Vial* be laid upon the back with a small straw upon one side of the *strings*, and another *Lute* or *Vial* be laid by it; and in the other *Lute* or *Vial* the *Vnison* to that *string* be stricken, it will make the *string* move; which will appear both to the *Eye*, and by the straws falling off. The like will be if the *Diapason* or *Eight* to that *string* be stricken, either in the same *Lute* or *Vial*, or in others lying by: But in none of these there is any report of *Sound* that can be discerned, but onely *Motion*.

279.

280.

It was devised, That a Vial should have a Lay of Wire-strings below, as close to the Belly as a *Lute*, and then the Strings of Guts mounted upon a Bridge, as in ordinary *Vials*; to the end, that by this means, the upper Strings stricken, should make the lower resound by Sympathy, and so make the Musick the better; which, if it be to purpose, than Sympathy worketh as well by report of Sound, as by Motion. But this device, I conceive, to be of no use, because the upper Strings which are stopped in great variety, cannot maintain a *Diapason* or a *Unison* with the lower, which are never stopped. But if it should be of use at all, it must be in Instruments which have no stops, as *Virginals* and *Harps*; wherein tryal may be made of two rows of Strings, distant the one from the other.

281.

The Experiment of Sympathy may be transferred (perhaps) from Instruments of Strings, to other Instruments of Sound. As to try, if there were in one Steeple two Bells of Unison, whether the striking of the one would move the other, more than if it were another accord: And so in *Pipes*, if they be of equal bore and sound,) whether a little Straw or Feather would move in the one *Pipe*, when the other is blown at an *Unison*.

282.

It seemeth both in *Ear* and *Eye*, the Instrument of *Sense* hath a Sympathy or Similitude with that which giveth the Reflexion (as hath been touched before.) For as the sight of the *Eye* is like a *Chrystal*, or *Glass*, or *Water*; so is the *Ear* a sinuous Cave with a hard Bone, to stop and reverberate the Sound: Which is like to the places that report *Eccho's*.

283.

Experiments
in Confort,
touching the
Hindring or
Helping of the
Hearing.

When a Man yawneth, he cannot hear so well. The cause is, for that the Membrane of the Ear is extended; and so rather casteth off the Sound, than draweth it to.

284.

We hear better when we hold our Breath, than contrary, insomuch, as in all listening to attain a Sound a far off, Men hold their Breath. The cause is, for that in all Expiration, the motion is outwards, and therefore rather driveth away the voice than draweth it: And besides, we see that in all labor to do things with any strength, we hold the Breath; and listening after any Sound that is heard with difficulty, is a kinde of labor.

285.

Let it be tryed, for the help of the Hearing, (and I conceive it likely to succeed) to make an Instrument like a Tunnel; the narrow part whereof may be of the bigness of the hold of the Ear; and the broader end much larger; like a Bell at the skirts, and the length half a foot or more. And let the narrow end of it be set close to the Ear. And mark whether any Sound abroad in the open Air, will not be heard distinctly, from further distance, than without that Instrument; being (as it were) an *Ear spectacle*. And I have heard there is in *Spain*, an Instrument in use to be set to the Ear, that helpeth somewhat those that are Thick of Hearing.

286.

If the Mouth be shut close, nevertheless there is yielded by the Roof of the Mouth, a Murmur; such as is used by Dumb men: But if the Nostrils be likewise stopped, no such Murmur can be made, except it be in the bottom of the Pallate towards the Throat. Whereby it appeareth manifestly, that a Sound in the Mouth, except such as aforesaid, if the Mouth be stopped, passeth from the Pallate through the Nostrils.

287.

Experiments
in Confort,
touching the
Spiritual and
Fine Nature
of Sounds.

The Repercussion of Sounds, (which we call *Eccho*) is a great Argument of the *Spiritual Essence* of Sounds. For if it were Corporeal, the Repercussing should be created in the same manner, and by like Instruments, with the

the original Sound: But we see what a number of exquisite Instruments must concur in speaking of words, whereof there is no such matter in the returning of them, but onely a plain stop, and repercussion.

The exquisite Differences of Articulate Sounds, carried along in the Air, shew that they cannot be Signatures or Impressions in the Air, as hath been well refuted by the Ancients. For it is true, that Seals make excellent Impressions; and so it may be thought of Sounds in their first generation: But then the Delation and Continuance of them, without any new sealing, shew apparently they cannot be Impressions.

All Sounds are suddenly made, and do suddenly perish; but neither that, nor the exquisite Differences of them, is matter of so great admiration: For the Quaverings, and Warblings of Lutes, and Pipes are as swift; and the Tongue (which is no very fine Instrument) doth in speech, make no fewer motions, than there be letters in all the words which are uttered. But that Sounds should not onely be so speedily generated, but carried so far every way, in such a momentary time, deserveth more admiration. As for example, If a man stand in the middle of a Field, and speak aloud, he shall be heard a Furlong in round, and that shall be in articulate Sounds, and those shall be entire in every little portion of the Air; and this shall be done in the space of less than a minute.

The sudden Generation and Perishing of Sounds, must be one of these two ways: Either, that the Air suffereth some force by Sound; and then restoreth it self as Water doth; which being divided, maketh many circles, till it restore it self to the Natural consistence; or otherwise, that the Air doth willingly imbibe the Sound as grateful, but cannot maintain it; for that the Air hath (as it should seem) a secret and hidden Appetite of receiving the Sound at the first; but then other gross and more materiate qualities of the Air straight ways suffocate it, like unto Flame which is generated with alacrity, but straight quenched by the enmity of the Air, or other Ambient Bodies.

There be these differences (in general) by which Sounds are divided:

1. Musical, Immusical.
2. Treble, Base.
3. Flat, Sharp.
4. Soft, Loud.
5. Exterior, Interior.
6. Clean, Harsh, or Purling.
7. Articulate, Inarticulate.

We have labored (as may appear) in this *Inquisition of Sounds* diligently; both because Sound is one of the most hidden portions of Nature, (as we said in the beginning) and because it is a *Virtue* which may be called *Incorporeal* and *Immateriate*, whereof there be in Nature but few. Besides, we were willing (now in these our first Centuries) to make a pattern or president of an *Exact Inquisition*; and we shall do the like hereafter in some other subjects which require it. For we desire that Men should learn and perceive how severe a thing the true *Inquisition of Nature* is; and should accustom themselves by the light of particulars, to enlarge their mindes to the amplitude of the World; and not to reduce the World to the narrowness of their Mindes.

288.

289.

290.

291.
Experiment
Solitary,
touching the
Orient Colours
in Dissolution
of Metals.

Metals give orient and fine Colours in Dissolution; as Gold giveth an excellent Yellow, Quick-silver an excellent Green, Tingiveth an excellent Azure. Likewise in their Putrefactions, or Rusts; as Vermilion, Verdegrease, Bile, Cirrus, &c. And likewise in their Vitrifications. The cause is, for that by their strength of Body, they are able to endure the Fire, or Strong-waters, and to be put into an equal posture, and again, to retain part of their principal Spirit: Which two things (equal posture, and quick Spirits) are required chiefly, to make Colours lightsome.

292.
Experiment
Solitary,
touching
Prolongation
of Life.

IT conduceth unto long Life, and to the more placide Motion of the Spirits, which thereby do less prey and consume the Juyce of the Body: either that *Mens actions be free and voluntary*, that nothing be done *invitâ minerva*, but *secundum genium*; or, on the other side, that the *Actions of Men be full of Regulation, and commands within themselves*: For then the victory and performing of the command, giveth a good disposition to the Spirits, especially if there be a proceeding from degree to degree, for then the sense of victory is the greater. An example of the former of these, is in a Countrey life; and of the latter, in *Monks and Philosophers*, and such as do continually enjoyn themselves.

293.
Experiment
Solitary,
touching
Appetite of
Union in
Bodies.

IT is certain, that in all Bodies, there is an *Appetite of Union*, and Evitation of Solution of Continuity: And of this Appetite there be many degrees, but the most remarkable, and fit to be distinguished, are three. The first in Liquors, the second in hard Bodies, and the third in Bodies cleaving or tenacious: In Liquors this Appetite is weak; we see in Liquors, the Threding of them in Stillicides (as hath been said) the falling of them in round drops (which is the form of Union) and the staying of them for a little time in Bubbles and Froth. In the second degree or kinde, this Appetite is strong; as in Iron, in Stone, in Wood, &c. In the third, this Appetite is in a *Medium* between the other two: For such Bodies do partly follow the touch of another Body, and partly stick and continue to themselves; and therefore they rope and draw themselves in threds, as we see in *Pitch, Grew, Birdlime, &c.* But note, that all solid Bodies are cleaving more or less; and that they love better the touch of somewhat that is tangible, than of Air. For Water in small quantity cleaveth to any thing that is solid, and so would Metal too, if the weight drew it not off. And therefore Gold Foliate, or any Metal Foliate, cleaveth: But those Bodies which are noted to be clammy, and cleaving, are such as have a more indifferent Appetite (at once) to follow another Body, and to hold to themselves. And therefore they are commonly *Bodies ill mixed*, and which take more pleasure in a *Foreign Body*, that in preserving there own consistence, and which have little predominance in *Drought or Moisture*.

294.
Experiment
Solitary,
touching the
like Operations
of Heat and
Time.

Time and Heat are fellows in many effects. Heat drieth Bodies that do easily expire; as Parchment, Leaves, Roots, Clay, &c. And so doth Time or Age are sic; as in the same Bodies, &c. Heat dissolveth and melteth Bodies that keep in their Spirits, as in divers *Liquefactions*; and so doth Time, in some Bodies of a softer consistence: As is manifest in Honey, which by Age waxeth more liquid, and the like in Sugar; and so in old Oyl, which is ever more clear and more hot in medicable use. Heat causeth the Spirits to search some issue out of the Body, as in the *Volatility*

of Metals; and so doth Time, as in the Rust of Metals. But generally Heat doth that in small time, which Age doth in long.

Some things which pass the Fire, are softest at first, and by Time grow hard, as the Crum of Bread. Some are harder when they come from the Fire, and afterwards give again, and grow soft as the Crust of Bread, Bisker, Sweet-Meats, Salt, &c. The cause is, for that in those things which wax hard with Time, the work of the Fire is a kinde of melting; and in those that wax soft with Time, (contrariwise) the work of the Fire is a kinde of Baking; and whatsoever the Fire baketh, Time doth in some degree dissolve.

Motions pass from one Man to another, not so much by exciting Imagination as by Invitation, especially if there be an Aptness or Inclination before. Therefore Gaping, or Yawning, and Stretching, do pass from Man to Man; for that that causeth Gaping or Stretching is, when the Spirits are a little Heavy, by any Vapor, or the like. For then they strive (as it were) to wring out, and expel that which loadeth them. So Men drowsy and desirous to sleep; or before the fit of an Ague, do use to yawn and stretch, and do likewise yield a Voice or Sound, which is an Interjection of Expulsion: So that if another be apt and prepared to do the like, he followeth by the sight of another. So the Laughing of another maketh to laugh.

There be some known Diseases that are Infectious, and others that are not. Those that are infectious, are first, Such as are chiefly in the Spirits, and not so much in the Humors, and therefore pass easily from Body to Body; such are Pestilences Lippitudes, and such like. Secondly, such as taint the breath, which we see passeth manifestly from Man to Man, and not invisible as the affects of the Spirits do; such are Consumptions of the Lungs, &c. Thirdly, Such as come forth to the skin, and therefore taint the Air, or the Body adjacent; especially, if they consist in an unctuous substance, not apt to dissipate; such are Scabs, and Leprosie. Fourthly, such as are meerly in the Humors, and not in the Spirits, Breath, or Exhalations: And therefore they never infect, but by touch onely; and such a touch also, as cometh within the *Epidermis*, as the venome of the *French Pox*, and the biting of a *Mad-Dog*.

Most Powders grow more close and coherent by mixture of Water, than by mixture of Oyl, though Oyl be the thicker Body; as *Meal*, &c. The reason is the Congruity of Bodies, which if it be more, maketh a perfecter imbibition, and incorporation; which in most Powders is more between them and Water, than between them and Oyl: But Painters colours ground, and ashes, do better incorporate with Oyl.

Much Motion and Exercise is good for some Bodies, and sitting and less motion, for others. If the Body be hot, and void of superfluous Moistures, too much Motion hurteth; and it is an error in *Physicians*, to call too much upon Exercise. Likewise, Men ought to beware, that they use not Exercise, and a spare diet, both; but if much Exercise, then a plentiful diet; and if sparing diet, then little Exercise. The Benefits that come of Exercise are. First, that it sendeth nourishment into the parts more forcibly.

295.
Experiment Solitary, touching the Differing Operations of Fire, and Time.

296.
Experiment Solitary, touching Motions by Invitation,

297.
Experiment Solitary, touching Infectious diseases.

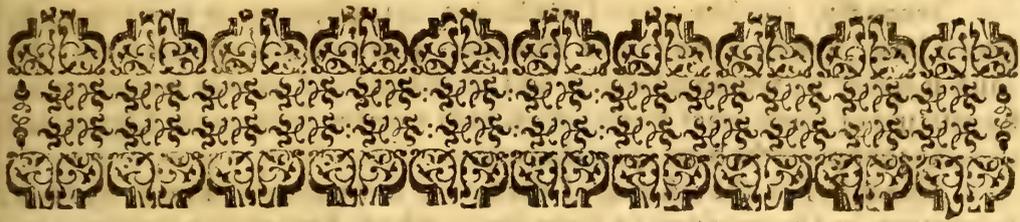

298.
Experiment Solitary, touching the Incorporation of Powders and Liquors.

299.
Experiment Solitary, touching Exercise of the Body.

Secondly, That it helpeth to excern by Sweat, and so maketh the parts assimilate the more perfectly. Thirdly, that it maketh the substance of the Body more solid and compact; and so less apt to be consumed and depredated by the Spirits. The Evils that come of Exercise, are, First, That it maketh the Spirits more hot and predatory. Secondly, That it doth absorb likewise, and attenuate too much the moisture of the Body. Thirdly, That it maketh too great Concussion, (especially, if it be violent) of the inward parts, which delight more in rest. But generally Exercise, if it be much, is no friend to prolongation of life; which is one cause, Why Women live longer then Men, because they stir less.

300.
Experiment
Solitary,
touching
Meats that in-
duce Satiety.

Some Food we may use long, and much, without glutting; as Bread, Flesh that is not Fat, or Rank, &c. Some other (though pleasant) glutteth sooner, as Sweet-Meats, Fat-Meats, &c. The cause is, for that Appetite consisteth in the emptiness of the Mouth, of the Stomach, or possessing it with somewhat that is astringent; and therefore, cold and dry: But things that are sweet and fat, are more filling, and do swim and hang more about the Mouth of the Stomach, and go not down so speedily; and again turn sooner to Choler, which is hot, and ever abateth the appetite. We see also, that another cause of Satiety, is an Over-custom; and of Appetite, is Novelty. And therefore Meats, if the same be continually taken, induce Loathing. To give the reason of the distaste of Satiety, and of the pleasure in Novelty, and to distinguish not onely in Meats and Drinks, but also in Motions, Loves, Company, Delight, Studies, what they be that Custom maketh more grateful; and what more tedious, were a large Field. But for Meats, the cause is Attraction, which is quicker, and more excited towards that which is new, than towards that whereof there remaineth a relish by former use. And (generally) it is a rule, That whatsoever is somewhat ingrate at first, is made grateful by Custom; but whatsoever is too pleasing at first, groweth quickly to Satiety.

NATURAL HISTORY.

Century IV.

Acceleration of Time, in *Works of Nature*, may well be esteemed *Inter Magnalia Natura*. And even in *Divine Miracles Accelerating of the Time*, is next to the *Creating of the Matter*. We will now therefore proceed to the enquiry of it; and for *Acceleration of Germination*, we will refer it over unto the place, where we shall handle the *Subject of Plants*, generally; and will now begin with other *Accelerations*.

Experiments in Consort, touching the Clarification of Liquors, and the Accelerating thereof.

Liquors are (many of them) at the first, thick and troubled; As *Must*, *Wort*, *Juyce of Fruits*, or *Herbs* expressed, &c. And by *Time*, they settle and clarify. But to make them clear, before the *Time*, is a great work; for it is a *Spur to Nature*, and putteth her out of her pace: And besides, it is of good use for making *Drinks*, and *Sauces*, *Potable*, and *Serviceable*, speedily. But to know the *Means of Accelerating Clarification*, we must first know the causes of *Clarification*. The first cause is, by the *Separation of the grosser parts of the Liquor, from the finer*. The second, by the equal distribution of the *Spirits of the Liquor, with the tangible parts*; for that ever representeth *Bodies clear and untroubled*. The third, by the refining the *Spirit it self*, which thereby giveth to the *Liquor more splendor, and more lustre*.

301.

First, For *Separation*: It is wrought by weight; as in the ordinary residence or settlement of *Liquors*. By *Heat*, by *Motion*, by *Precipitation*, or *Sublimation*, (that is, a calling of the several parts, either up or down, which is a kinde of *Attraction*.) by *Adhesion*; as when a *Body, more viscus, is mingled and agitated with the Liquor*; which viscus *Body* (afterwards se-
vered)

302.

vered) draweth with it the grosser parts of the Liquor: And lastly, by Percolation or Passage.

303. Secondly, For the even Distribution of the Spirits, it is wrought by gentle heat, and by Agitation of Motion; (for of Time we speak not, because it is that we would anticipate and represent :) And it is wrought also, by mixture of some other Body, which hath a vertue to open the Liquor, and to make the Spirits the better pass thorow.

304. Thirdly, For the refining of the Spirit, it is wrought likewise by Heat, by motion, and by mixture of some Body which hath vertue to attenuate. So therefore (having shewed the causes) for the accelerating of Clarification in general, and the enducing of it; take these Instances and Tryals.

305. It is in common practice, to draw Wine or Beer, from the Lees, (which we call *Racking*) whereby it will clarify much the sooner: For the Lees, though they keep the drink in heart, and make it lasting; yet withal they cast up some spissitude; and this Instance is to be referred to Separation.

306. On the other side, it were good to try, what, the adding to the Liquor, more Lees than his own, will work; for though the Lees do make the Liquor turbid, yet they refine the Spirits. Take therefore a Vessel of new Beer, and take another Vessel of new Beer, and rack the one Vessel from the Lees, and pour the Lees of the racked Vessel into the unracked Vessel, and see the effect. This Instance is referred to the Refining of the Spirits.

307. Take new Beer, and put in some quantity of stale Beer into it, and see whether it will not accelerate the Clarification, by opening the Body of the Beer, and cutting the grosser parts, whereby they may fall down into Lees. And this Instance again is referred to *Separation*.

308. The longer *Molt* or *Herbs*, or the like, are infused in *Liquor*, the more thick and troubled the *Liquor* is; but the longer they be decocted in the *Liquor*, the clearer it is. The reason is plain, because in Infusion, the longer it is, the greater is the part of the gross Body that goeth into the Liquor: But in Decoction, though more goeth forth, yet it either purgeth at the top, or setteth at the bottom. And therefore the most exact way to clarify is, first, to Infuse, and then to take off the Liquor and decoct it; as they do in Beer, which hath Molt first infused in the Liquor, and is afterwards boiled with the Hop. This also is referred to *Separation*.

309. Take hot Embers, and put them about a Bottle filled with new Beer, almost to the very neck; let the Bottle be well stopped, lest it flie out: And continue it, renewing the Embers every day by the space of ten days, and then compare it with another Bottle of the same Beer set by. Take also Lime, both quenched and unquenched, and set the Bottles in them *ut supra*. This Instance is referred, both to the even Distribution, and also to the Refining of the *Spirits by Heat*.

310. Take Bottles and swing them, or carry them in a Wheel-Barrow upon rough Ground, twice in a day: But then you may not fill the Bottles full, but leave some Air; for if the Liquor come close to the stopple, it cannot play nor flower: And when you have shaken them well either way, pour the Drink in another Bottle, stopped close after the usual manner; for if it stay with much Air in it, the Drink will pall, neither will it settle so perfectly in all the parts. Let it stand some Twenty four hours, then take it, and put it again into a Bottle with Air, *ut supra*; and thence into a Bottle stopped, *ut supra*; and so repeat the same operation for seven days. Note, that in the emptying of one Bottle into another, you must do it swiftly, lest the Drink pall.

pall. It were good also to try it in a Bottle with a little air below the Neck without emptying. This Instance is referred to the even *Distribution* and *Refining* of the *Spirits* by *Motion*.

As for Percolation, inward, and outward (which belongeth to *Separation*;) Tryal would be made of Clarifying by Adhesion, with Milk put into new Beer, and stirred with it: For it may be, that the grosser part of the Beer will cleave to the *Milk*; the doubt is, whether the Milk will sever well again, which is soon tried. And it is usual in clarifying *Ippocrasse* to put in Milk, which after severeth and carrieth with it the grosser parts of the *Ippocrass*, as hath been said elsewhere. Also for the better Clarification by Percolation; when they Tun new Beer, they use to let it pass through a Strainer, and it is like the finer the Strainer is, the clearer it will be.

THe *Accelerating* of *Maturation*, we will now enquire of, and of *Maturation* it self. It is of three natures, the *Maturation* of *Fruits*, the *Maturation* of *Drinks*, and the *Maturation* of *Impossthumes* and *Vleers*. This last we refer to another place, where we shall handle *Experiments Medicinal*. There be also other *Maturations*, as of *Metals*, &c. whereof we speak as occasion serveth. But we will begin with that of *Drinks*, because it hath such affinity with the Clarification of *Liquors*.

For the *Maturation* of *Drinks*, it is wrought by the *Congregation* of the *Spirits* together, whereby they digest more perfectly the grosser parts; and it is effected, partly by the same means that Clarification is (whereof we spake before :) But then note, that an extream Clarification doth spread the *Spirits* so smooth, as they become dull, and the drink dead, which ought to have a little flowring. And therefore all your clear *Amber drink* is flat.

We see the degrees of *Maturation* of *Drinks*, in *Must*, in *Wine*, as it is drunk, and in *Vinegar*. Whereof *Must* hath not the *Spirits* well congregated, *Wine* hath them well united, so as they make the parts somewhat more Oily. *Vinegar* hath them congregated, but more *Jejune*, and in smaller quantity; the greatest and finest *Spirit* and part being exhaled: For we see *Vinegar* is made by setting the *Vessel* of *Wine* against the hot *Sun*. And therefore *Vinegar* will not burn, for that much of the finer part is exhaled.

The refreshing and quickning of *Drink* palled or dead, is by enforcing the motion of the *Spirit*. So we see that open weather relaxeth the *Spirit*, and maketh it more lively in *Motion*. We see also *Bottelling* of *Beer* or *Ale*, while it is new and full of *Spirit*, (so that it spirteth when the stopple is taken forth) maketh the *Drink* more quick and windy. A *Pan* of *Coals* in the *Cellar*, doth likewise good, and maketh the *Drink* work again. New *Drink* put to *Drink* that is dead, provoketh it to work again: *Nay*, which is more (as some affirm) a *Brewing* of new *Beer*, set by old *Beer*, maketh it work again: It were good also to enforce the *Spirits* by some mixtures, that may excite and quicken them, as by the putting into the *Bottles*, *Nitre* *Chalk*, *Lime*, &c. We see *Cream* is matured, and made to rise more speedily by putting in cold *Water*; which, as it seemeth, getteth down the *Whey*.

It is tryed, that the burying of *Bottles* of *Drink* well stopped, either in dry *Earth*, a good depth, or in the bottom of a *Well* within *Water*; and best of

311.

Experiments in Consort, touching *Maturation*, and the *Accelerating* thereof. And first touching the *Maturation* and *Quickning* of drinks, and next touching the *Maturation* of *Fruits*.

312.

313.

314.

315.

of all, the hanging of them in a deep Well somewhat above the Water, for some fortnights space, is an excellent means of making Drink fresh and quick: For the cold doth not cause any exhaling of the Spirits at all, as heat doth, though it rarifieth the rest that remain: But cold maketh the Spirits vigorous, and irritateth them, whereby they incorporate the parts of the Liquor perfectly.

316. As for the *Maturation of Fruits*, it is wrought by the calling forth of the Spirits of the Body outward, and so spreading them more smoothly; and likewise by digesting, in some degree, the grosser parts: And this is effected by Heat, Motion, Attraction, and by a Rudiment of Putrefaction: For the Inception of Putrefaction hath in it a *Maturation*.
317. There were taken Apples, and laid in Straw, in Hay, in Flower, in Chalk, in Lime, covered over with Onions, covered over with Crabs, closed up in Wax, shut in a Box, &c. There was also an Apple hanged up in smoak. Of all which the Experiment sorted in this manner.
318. After a moneths space, the Apple, enclosed in Wax, was as Green and fresh as at the first putting in, and the Kernels continued White. The cause is, for that all exclusion of open Air, (which is ever predatory) maintaineth the Body in his first freshness and moisture; but the inconvenience is, that it tasteth a little of the Wax, which, I suppose, in a Pomegranate, or some such thick coated fruit, it would not do.
319. The Apple hanged in the smoak, turned like an old Mellow-Apple wrinkled, dry, soft, sweet, yellow within. The cause is, for that such a degree of heat, which doth neither melt nor scorch (for we see that in a greater heat, a roast Apple softneth and melteth, and Pigs feet made of quarters of Wardens, scorch and have a skin of coal) doth Mellow, and not adure: The smoak also maketh the Apple (as it were) sprinkled with Soot, which helpeth to mature. We see, that in drying of Pears and Prunes, in the Oven, and removing of them often as they begin to sweat, there is a like operation: but that is with a far more intense degree of heat.
320. The Apples covered in the Lime and Ashes, were well matured as appeared both in their yellowness and sweetness. The cause is, for that that Degree of Heat, which is in Lime and Ashes, (being a smothering heat) is of all the rest most proper; for it doth neither Liquefie nor Arefie, and that is true Maturation. Note, that the taste of those Apples was good, and therefore it is the Experiment fittest for use.
321. The Apples covered with Crabs and Onions, were likewise well matured. The cause is not any heat, but for that the Crabs and the Onions draw forth the Spirits of the Apple, and spread them equally thorowout the Body; which taketh away hardness. So we see one Apple ripeneth against another. And therefore in making of Cider, they turn the Apples first upon a heap; so one Cluster of Grapes, that toucheth another whilest it groweth, ripeneth faster. *Botrus contra Botrum citius maturescit.*
322. The Apples in Hay and the Straw, ripened apparently, though not so much as the other, but the Apple in the Straw, more. The cause is, for that the Hay and Straw have a very low degree of Heat, but yet close and smothering, and which dryeth not.
323. The Apple in the close Box was ripened also. The cause is, for that all Air kept close, hath a degree of warmth; as we see in Wool, Fur, Plush, &c.

Note, That all these were compared with another Apple of the same kind that lay of it self; and in comparison of that, were more sweet, and more yellow, and so appeared to be more ripe.

Take an Apple, or Pear, or other like Fruit, and roul it upon a Table hard: We see in common experience, that the rouling doth soften and sweeten the Fruit presently, which is nothing but the smooth distribution of the Spirits into the parts; for the unequal distribution of the Spirits maketh the harrishness: But this hard rouling is between Concoction, and a simple Maturation; therefore, if you should roul them but gently perhaps twice a day, and continue it some seven days, it is like they would Mature more finely, and like unto the *Natural Maturation*.

Take an Apple, and cut out a piece of the top and cover it, to see whether that *Solution of Continuity* will not hasten a Maturation. We see that where a *Wasp*, or a *Fly*, or a *Worm*, hath bitten in a *Grape* or any *Fruit*, it will sweeten hastily.

Take an Apple, &c. and prick it with a Pin full of Holes, not deep, and smear it a little with Sack, or Cinnamon Water, or Spirit of Wine, every day for ten days, to see if the *Virtual Heat* of the Wine, or Strong-Waters, will not Mature it.

In these Tryals also as was used in the first, set another of the same Fruits by, to compare them, and try them by their *Tellowness*, and by their *Sweetness*.

THe World hath been much abused by the opinion of Making of Gold. The Work it self, I judge to be possible; but the Means (hitherto propounded) to effect it, are in the Practice, full of Error and Imposture; and in the Theory, full of unsound Imaginations. For to say, that *Nature* hath an intention to make all Metals Gold; and that, if she were delivered from Impediments, she would perform her own work; and that, if the Crudities, Impurities, and Leprosies of Metals were cured, they would become Gold; and that a little quantity of the Medicine in the Work of Projection, will turn a Sea of the baser Metal into Gold by multiplying. All these are but dreams, and so are many other Grounds of *Alchymy*. And to help the matter, the *Alchymists* call in likewise many vanities, out of *Astrology*, *Natural Magick*, Superstitious Interpretations of Scriptures, Auricular Traditions, Feigned Testimonies of Ancient Authors, and the like. It is true, on the other side they have brought to light not a few profitable Experiments, and thereby made the World some amends: But we, when we shall come to handle the *Version* and *Transmutation* of Bodies, and the Experiments concerning *Metals* and *Minerals*; will lay open the true Ways and Passages of *Nature*, which may lead to this great effect. And we commend the wit of the *Chineses*, who despair of making of Gold, but are mad upon the making of Silver. For certain it is, That it is more difficult to make Gold, (which is the most ponderous and materiate amongst Metals) of other Metals, less ponderous and less materiate, than (*Via versâ*) to make Silver of Lead, or Quick-silver; both which are more ponderous than Silver: So that they need rather a further degree of *Fixation*, than any *Condensation*. In the mean time, by occasion of handling the *Axioms* touching *Maturation*, we will direct a tryal touching the *Maturing* of Metals, and thereby turning some of them into Gold; for we conceive indeed, That a perfect good *Concoction*, or *Disgestion*, or *Maturation* of some Metals will produce Gold. And here we call to minde, that we knew a *Dutchman* that had wrought himself into the belief of a great

324.

325.

326.

Experiment Solitary, touching the Making of Gold.

great person, by undertaking, that he could make Gold : Whose discourse was, That Gold might be made, but that the *Alchymists* over-fired the work : For (he said) the making of Gold did require a very temperate Heat, as being in *Nature* a subterrany work, where little Heat cometh ; but yet more to the making of Gold, than of any other Metal : And therefore, that he would do it with a great Lamp, that should carry a temperate and equal Heat, and that it was the work of many Moneths. The devise of the Lamp was folly, but the overfiring now used, and the equal Heat to be required, and the making it a work of some good time, are no ill discourses.

We resort therefore to our *Axioms of Maturation*, in effect touched before.

The first is, That there be used a Temperate Heat ; for they are ever Temperate Heats that Digests, and Mature ; wherein we mean Temperate, according to the Nature of the Subject : For that may be Temperate to Fruits and Liquors, which will not work at all upon Metals.

The second is, That the Spirit of the Metal be quickned, and the Tangible Parts opened : For without those two operations, the Spirit of the Metal, wrought upon, will not be able to digest the Parts.

The third is, That the Spirits do spread themselves even, and move not subfultorily, for that will make the parts close and pliant. And this requireth a Heat that doth not rise and fall, but continue as equal as may be.

The fourth is, That no part of the Spirit be emitted but detained : For if there be Emission of Spirit, the Body of the Metal will be hard and churlish. And this will be performed, partly by the temper of the Fire, and partly by the closeness of the Vessel.

The fifth is, That there be choice made of the likeliest and best prepared Metal for the Version ; for that will facilitate the Work.

The sixth is, That you give time enough for the Work, not to prolong hopes (as the *Alchymists* do, but indeed to give *Nature* a convenient space to work in.

These principles most certain and true, we will now derive a direction of Tryal out of them, which may (perhaps) by further Meditation be improved.

327.

Let there be a small Furnace made of a Temperate Heat ; let the heat be such as may keep the Metal perpetually molten, and no more ; for that above all, importeth to the Work : For the Material, take Silver, which is the Metal, that in *Nature*, symbolizeth most with Gold ; put in also, with the Silver a tenth part of Quick-silver ; and a twelfth part of Nitre by weight : Both these to quicken and open the Body of the Metal ; and so let the Work be continued by the space of Six Moneths, at the least. I wish also, That there be as sometimes an Injection of some Oyled Substance ; such as they use in the recovering of Gold, which by vexing with Separations hath been made churlish : And this is, to lay the parts more close and smooth, which is the main work. For Gold (as we see) is the closest (and therefore the heaviest) of Metals ; and is likewise the most flexible and tensible. Note, That to think to make Gold of Quick-silver because it is the heaviest, is a thing not to be hoped ; for Quick-silver will not endure the mannage of the Fire : Next to Silver, I think Copper were fittest to be the Material.

Gold

Gold hath these Natures: Greatness of VWeight, Closeness of Parts, Fixation, Pliantness or Softness, Immunity from Rust, Colour or Tincture of Yellow. Therefore the sure way (though most about) to make Gold, is to know the causes of the several Natures before rehearsed, and the Axioms concerning the same. For if a Man can make a Metal that hath all these Properties, let Men dispute, whether it be Gold, or no?

328.
Experiment
Solitary,
touching the
Nature of
Gold.

THe Enducing and Accelerating of Putrefaction, is a subject of a very Universal Enquiry. For Corruption is a Reciprocal to Generation; and they two are as Natures to Terms or Boundaries; and the Guides to Life and Death, Putrefaction is the VVork of the Spirits of Bodies, which ever are unquiet to get forth and congregate with the Air, and to enjoy the Sun-Beams. The getting forth, or spreading of the Spirits, (which is a degree of getting forth) have five differing operations. If the Spirits be detained within the Body, and move more violently, there followeth Colliquation; as in Metals, &c. If more mildly, there followeth Digestion or Maturation; as in Drinks and Fruits. If the Spirits be not meerly detained, but Protrude a little, and that Motion be confused, and inordinate, there followeth Putrefaction; which ever dissolveth the Consistence of the Body into much inequality; as in Flesh, Rotten Fruits, Shining VVood, &c. and also in the Rust of Metals. But if that Motion be in a certain order, there followeth Vivification and Figuration; as both in Living Creatures bred of Putrefaction, and in Living Creatures perfect. But if the Spirits issue out of the Body, there followeth Desiccation, Induration, Consumption, &c. As in Brick, evaporation of Bodies Liquid, &c.

Experiments
in Confort,
touching the
Enducing and
Accelerating
of Putrefacti-
on.

The Means to enduce and accelerate Putrefaction, are, First, By adding some crude or watry moisture; as in VVetting of any Flesh, Fruit, Wood, with Water, &c. For contrariwise, Unctuous and Oily Substances preserve.

329.

The second is, By Invitation or Excitation; as when a rotten Apple lieth close to another Apple that is sound; or when Dung (which is a substance already putrified) is added to other Bodies. And this is also notably seen in Church-yards, where they bury much; where the Earth will consume the Corps, in far shorter time than other Earth will.

330.

The third is, By Closeness and Stopping, which detaineth the Spirits in Prison, more then they would, and thereby irritateth them to seek issue; as in Corn and Cloaths which wax musty; and therefore open Air (which they call *Aer perflabilis*) doth preserve: And this doth appear more evidently in Agues, which come (most of them) of obstructions and penning the Humors, which thereupon Putrifie.

331.

The fourth is, By Solution of Continuity; as we see an Apple will rot sooner, if it be cut or pierced, and so will Wood, &c. And so the Flesh of Creatures alive, where they have received any wound.

332.

The fifth is, Either by the Exhaling, or by the driving back of the principal Spirits, which preserve the consistence of the Body; so that when their Government is dissolved every part returneth to his Nature, or Homogeny. And this appeareth in Urine and Blood, when they cool and thereby break. It appeareth also in the Gangreen or Mortification of Flesh, either by Opiates, or by Intense Colds. I conceive also, the same effect

333.

is in Pestilences, for that the malignity of the infecting vapor, chaunth the principal Spirits, and maketh them flie, and leave their Regiment; and then the Humors, Flesh, and Secondary Spirits, do dissolve and break, as in an Anarchy.

334. The sixth is, VVhen a Forreign Spirit, stronger and more eager than the Spirit of the Body, entreth the Body, as in the stinging of Serpent. And this is the cause (generally) that upon all Poysons followeth Swelling; and we see Swelling followeth also, when the Spirits of the Body it self congregate too much; as upon blows and bruises, or when they are pent in too much, as in Swelling upon Cold. And we see also, that the Spirits coming of Putrefaction of Humors in Agues, &c. which may be counted as Foreign Spirits, though they be bred within the Body, do extinguish and suffocate the Natural spirits and heat.

335. The seventh is, By such a weak degree of heat, as setteth the Spirits in a little Motion, but is not able either to digest the parts, or to issue the Spirits, as is seen in Flesh kept in a room that is not cool; whereas in a cool and wet Larder it will keep longer. And we see, that Vivification (whereof Putrefaction is the Bastard Brother) is effected by such soft heats; as the hatching of Eggs, the heat of the VVomb, &c.

336. The eighth is, By the releasing of the Spirits, which before were close kept by the solidness of their coverure, and thereby their appetite of issuing checked; as in the artificial rusts induced by Strong waters in Iron, Lead, &c. And therefore wetting hastneth Rust or Putrefaction of anything, because it softneth the Crust, for the Spirits to come forth.

337. The ninth is, By the interchange of heat and cold, or wet and dry; as we see in the Moulding of Earth in Frosts, and Sun; and in the more hasty rotting of VVood, that is sometimes wet, sometimes dry.

338. The tenth is, By time, and the work, and procedure of the Spirits themselves, which cannot keep their station; especially, if they be left to themselves, and there be not Agitation or Local Motion. As we see in Corn not stirred, and Mens Bodies not exercised.

339. All Moulds are Inceptions of Putrefaction; as the Moulds of Pyes and Flesh the Moulds of Orenge and Lemmons, which Moulds afterwards turn into VVorms, or more odious Putrefactions: And therefore (commonly) prove to be of ill odor. And if the Body be liquid, and not apt to putrifie totally, it will cast up a Mother in the top, as the Mothers of Distilled waters.

340. Moss is a kinde of Mold of the Earth and Trees: But it may be better sorted as a Rudiment of Germination, to which we refer it.

Experiments
in Consort,
touching
Prohibiting
and Prevent-
ing Putre-
faction.

IT is an Enquiry of excellent use to enquire of the Means of Preventing or Staying of Putrefaction; for therein consisteth the Means of Conservation of Bodies: For Bodies have two Kindes of Dissolutions, the one by Consumption and Diccation, the other by Putrefaction. But as for the Putrefactions of the Bodies of Men and Living Creatures (as in Agues, VVorms, Consumptions of the Lungs, Imposthums, and Ulcers, both inwards and outwards) they are a great part of Physick and Surgery: And therefore we will reserve the Enquiry of them to the proper place, where we shall handle Medicinal Experiments of all sorts. Of the rest, we will now enter into an Enquiry, wherein much light may be taken from that which hath been said of the Means to enduce or accelerate Putrefaction: For the removing that which caused Putrefaction, doth prevent and avoid Putrefaction.

The first Means of prohibiting or checking Putrefaction is cold; for so we see that Meat and Drink will last longer, unputrified, or untowred, in Winter, than in Summer: And we see that Flowers, and Fruits; put in conservatories of Snow, keep fresh. And this worketh by the Detention of the Spirits, and constipation of the Tangible parts.

341.

The second is Astringion: For Astringion prohibiteth Dissolution; as we see (generally) in Medicines, whereof such as are Astringents do inhibit Putrefaction: And by the same reason of Astringency, some small quantity of Oyl of Vitriol, will keep fresh water long from putrifying. And this Astringion is in a substance that hath a virtual cold, and it worketh (partly) by the same means that cold doth.

342.

The third is, The excluding of the Air; and again, the exposing to the Air: For these contraries, (as it cometh often to pass) work the same effect, according to the nature of the Subject-matter. So we see, that Beer or Wine in Bottles close stopped, last long; that the Garners under Ground keep Corn longer, than those above Ground; and that Fruit closed in Wax, keepeth fresh: And likewise, Bodies put in Honey, and Flower, keep more fresh: And Liquors, Drinks, and Juyces, with a little Oyl cast on the top, keep fresh. Contrariwise, we see that Cloath and Apparel, not aired, do breed Moaths and Mould; and the Diversity is, that in Bodies that need Detention of Spirits, the Exclusion of the Air doth good; as in Drinks, and Corn: But in Bodies that need Emission of Spirits, to discharge some of the superfluous moisture, it doth hurt, for they require airing.

343.

The fourth is Motion, and Stirring; for Putrefaction asketh Rest: For the subtil Motion which Putrefaction requireth, is disturbed by any Agitation, and all Local Motion keepeth Bodies integral, and their parts together: As we see, that turning over of Corn in a Garner, or Letting it run like an Hour-Glass, from an upper Room into a lower, doth keep it sweet: And running Waters putrifie not; and in Mens Bodies, exercise hindreth Putrefaction; and contrarywise Rest, and want of Motion or stoppings (whereby the running of Humors, or the Motion of Perspiration, is stayed) further Putrefaction; as we partly touched a little before.

344.

The fifth is, The Breathing forth of the Adventitious Moisture in Bodies, for as wetting doth hasten Putrefaction; so convenient drying (whereby the more Radical Moisture is onely kept in) putteth back Putrefaction: So we see that Herbs and Flowers, if they be dried in the shade, or dried in the hot Sun, for a small time keep best. For the Emission of the loose and adventitious Moisture, doth betray the Radical Moisture, and carryeth it out for company.

345.

The sixth is, The strengthening of the Spirits of Bodies; for as a great heat keepeth Bodies from Putrefaction; but a tepide heat enclineth them to Putrefaction: So a strong Spirit likewise preserveth, and a weak or faint Spirit disposeth to corruption. So we finde, that Salt-water corrupteth not so soon as fresh; and salting of Oysters, and powdring of Meat, keepeth them from Putrefaction. It would be tryed also, whether Chalk, put into Water, or Drink, doth not preserve it from Putrifying, or speedy Souring. So we see that Strong-Beer will last longer than small, and all things, that are hot and aromatical, do help to preserve Liquors, or Powders, &c. which they do, as well by strengthening the Spirits, as by soaking out the loose Moisture.

346.

347.

The seventh is, *Separation of the cruder parts*, and thereby making the Body more equal ; for all unperfect mixture is apt to putrifie, and Watry substances are more apt to putrifie, than oily. So, we see distilled Waters will last longer than raw Waters, and things that have passed the Fire, do last longer than those that have not passed the Fire ; as dried Pears, &c.

348.

The eighth is, *The drawing forth continually of that part, where the Putrefaction beginneth* ; Which is (commonly) *the looje and watry moisture* ; not onely for the reason before given, that it provoketh the radical moisture to come forth with it ; but because being detained in the Body, the Putrefaction taking hold of it, infecteth the rest : As we see in the Embalming of Dead Bodies. And the same reason is, of preserving Herbs, or Fruits, or Flowers, in Bran or Meal.

349.

The ninth is, *The commixture of any thing that is more oily or sweet* : For such Bodies are least apt to putrifie, the Air working little upon them, and they not putrifying preserve the rest. And therefore we see Syrrups and Oyntments will last longer than Juyces.

350.

The tenth is, *The commixture of somewhat that is dry* ; for Putrefaction beginneth first from the Spirits, and then from the moisture ; and that that is dry, is unapt to putrifie. And therefore smoak preserveth flesh ; as we see in Bacon, and Neats-Tongues, and *Martlemas-Beef, &c.*

351.

The opinion of some of the Ancients, That blown Airs do preserve Bodies longer than other Airs, seemeth to me probable ; for that the blown Airs, being over-charged and compressed, will hardly receive the exhaling of any thing, but rather repulie it. It was tryed in a blown Bladder, wherinto flesh was put, and likewise a Flower, and it sorted not : For dry Bladders will not blow, and new Bladders rather further Putrefaction. The way were therefore, to blow strongly with a pair of Bellows, into a Hogshhead, putting into the Hogshhead (before) that which you would have preserved ; and in the instant that you withdraw the Bellows, stop the hole close.

352.
Experiment
Solitary,
touching
Wood Shining
in the Dark.

THE Experiment of Wood that shineth in the dark, we have diligently driven and pursued : The rather, for that of all things that give light here below, it is the most durable, and hath least apparent motion. Fire and Flame are in continual expence ; Sugar shining onely while it is in scraping ; and Salt-water while it is in dashing ; Gloworms have their shining while they live, or a little after ; onely Scales of Fishes (putrified) seem to be of the same nature with shining Wood. And it is true, that all Putrefaction hath with it an inward motion, as well as Fire or Light. The tryal sorted thus.

1. The shining is in some pieces more bright, in some more dim ; but the most bright of all doth not attain to the light of a Gloworm.
2. The Woods that have been tryed to shine, are chiefly Sallow and Willow ; also, the Ash and Hasle, it may be, it holdeth in others.
3. Both Roots, and Bodies do shine. but the Roots better.
4. The colour of the shining part, by day-light, is in some pieces white, in some pieces inclining to red ; which in the Country they call the White and Red Carret.
5. The part that shineth, is (for the most part) somewhat soft, and moist to feel to ; but some was found to be firm and hard ; so as it might be figured into a Cross, or into Beads, &c. But you must not look to have an Image, or the like, in any thing that is Lightsom ; for even a Face in Iron red hot, will

will

will not be seen, the light confounding the small differences of lightsome and darksome, which shew the figure. 6. There was the shining part pared off, till you came to that, that did not shine; but within two days the part contiguous began also to shine, being laid abroad in the Dew; so as it seemeth the putrefaction spreadeth. 7. There was other dead Wood of like kinde that was laid abroad, which shined not at the first; but after a nights lying abroad, begin to shine. 8. There was other Wood that did first shine, and being laid dry in the House, within five or six days lost the shining; and laid abroad again, recovered the shining. 9. Shining Woods being laid in a dry room, within a seven night lost their shining; but being laid in a Cellar, or dark room, kept the shining. 10. The boring of holes in that kinde of Wood, and then laying it abroad, seemeth to conduce to make it shine; the cause is, for that all solution of continuity, doth help on putrefaction, as was touched before. 11. No Wood hath been yet tryed to shine that was cut down alive, but such as was rooted both in Stock and Root while it grew. 12. Part of the Wood that shined, was steeped in Oyl and retained the shining a fortnight. 13. The like succeeded in some steeped in Water, and much better. 14. How long the shining will continue, if the Wood be laid abroad every night, and taken in and sprinkled with Water in the day, is not yet tryed. 15. Tryal was made of laying it abroad in frosty weather, which hurt it not. 16. There was a great piece of a Root, which did shine, and the shining part was cut off, till no more shined; yet after two nights, though it were kept in a dry Room, it got a shining.

THe bringing forth of Living Creatures may be accelerated in two respects: The one, if the Embryon ripeneth and perfecteth sooner; the other, if there be some cause from the Mothers Body of Expulsion or putting it down: Whereof the former is good, and argueth strength; the latter is ill, and cometh by accident or disease. And therefore the Ancient observation is true, that the *Childe born in the Seventh Moneth*, doth commonly well; but *Born in the Eighth Moneth*, doth (for the most part) die. But the cause assigned is fabulous, which is, That in the Eighth Moneth should be the return of the reign of the Planet *Saturn*, which (as they say) is a Planet malign; whereas in the Seventh is the reign of the *Moon*, which is a Planet propitious. But the true cause is, for that where there is so great a prevention of the ordinary time, it is the lustiness of the Childe; but when it is less, it is some indisposition of the Mother.

TO Accelerate Growth or Stature, it must proceed; Either from the Plenty of the Nourishment, or from the Nature of the Nourishment, or from the Quickning and Exciting of the Natural heat. For the first, Excess of Nourishment, is hurtful; for it maketh the Childe corpulent, and growing in breadth, rather than in height. And you may take an Experiment from Plants, which if they spread much, are seldom tall. As for the Nature of the Nourishment; First, it may not be too dry, and therefore Children in Dairy Countreys do wax more tall, than where they feed more upon Bread and Flesh. There is also a received tale, that boyling of Daisie-Roots in Milk (which it is certain are great dryers) will make Dogs little. But so much is true, That an over-dry Nourishment in Childhood putteth back Stature. Secondly, The Nourishment must be of an opening

353.
Experiment

touching the
Acceleration
of Birth.

354.
Experiment
Solitary,
touching the
Acceleration
of Growth and
Stature.

Nature; for that attenuate the Juice, and furthereth the Motion of the Spirits upwards. Neither is it without cause, that *Xenophon* in the Nouriture of the *Persian Children*, doth so much commend their feeding upon *Cardamon*, which (he saith) made them grow better, and be of a more active habit. *Cardamon* is in Latin, *Nasturium*, and with us *Water-creffes*; which, it is certain, is an Herb, that whilst it is young, is friendly to Life. As for the quickning of Natural Heat, it must be done chiefly with exercise; and therefore (no doubt) much going to School, where they sit so much, hindereth the growth of Children; whereas Countrey-People, that go not to School, are commonly of better stature. And again, Men must beware how they give Children any thing that is cold in operation; even long sucking doth hinder both Wit and Stature. This hath been tryed, that a Whelp that hath been fed with *Nitre* in *Milk*, hath become very little, but extream lively: For the Spirit of *Nitre* is cold. And though it be an excellent Medicine in strength of years for Prolongation of Life; yet it is in Children and young Creatures an enemy to growth; and all for the same reason, For Heat is requisite to Growth. But after a Man is come to his middle age, Heat consumeth the Spirits; which the coldness of the Spirit of *Nitre* doth help to condense and correct.

Experiments
in Consort,
touching
Sulphure and
Mercury, two
of *Paracelsus*
Principles.

There be two great Families of Things, you may term them by several names, *Sulphureous* and *Mercurial*, which are the *Chymists* words: (For as for their *Salt*, which is their third Principle, it is a Compound of the other two,) *Inflamable*, and *Not Inflamable*; *Mature* and *Crude*, *Oily* and *Watry*: For we see that in *Subterrancies* there are, as the Fathers of their Tribes, *Brimstone* and *Mercury*; In *Vegetables* and *Living Creatures*, there is *Water* and *Oyl*; in the *Inferior* order of *Pneumatics*, there is *Air* and *Flame*; and in the *Superior*, there is the *Body* of the *Star*, and the *Pure Skey*. And these Pairs, though they be unlike in the *Primitive Differences* of *Matter*, yet they seem to have many consents; for *Mercury* and *Sulphure* are principal materials of *Metals*; *Water* and *Oyl* are principal materials of *Vegetables* and *Animals*, and seem to differ but in *Maturation* or *Concoction*. *Flame* (in *Vulgar Opinion*) is but *Air* incensed, and they both have quickness of *Motion*, and facility of *Cession*, much alike: And the *Interstellar Skey*, (though the opinion be vain, that the *Star* is the *Denser Part* of his *Orb*,) hath notwithstanding so much affinity with the *Star*, that there is a rotation of that, as well as of the *Star*. Therefore, it is one of the greatest *Magnalia Natura*, to turn *Water* or *Watry Juice* into *Oyl* or *Oily Juice*: Greater in *Nature*, than to turn *Silver* or *Quick-silver* into *Gold*.

355.

The Instances we have wherein *Crude* and *Watry Substance*, turneth into *Fat* and *Oily*, are of four kindes. First, In the *Mixture* of *Earth* and *Water*, which mingled by the help of the *Sun*, gathered a *Nitrous Fatness*, more than either of them have severally; As we see, in that they put forth *Plants*, which need both *Juyces*.

356.

The second is in the *Affimilation* of *Nourishment*, made in the *Bodies* of *Plants*, and *Living Creatures*; whereof *Plants* turn the *Juyce* of *meer Water* and *Earth*, into a great deal of *Oily matter*: *Living Creatures*, though much of their *Fat*, and *Flesh*, are out of *Oily Aliments*, (as *Meat*, and *Bread*,) yet they *affimilate* also in a *measure* their *Drink* of *Water*,

&c. But these two ways of Version of Water into Oyl, (namely, by Mixture and by Assimilation) are by many Passages, and Percolations, and by continuance of soft Heats, and by circuits of Time.

The third is in the Inception of Putrefaction; as in Water corrupted, and the Mothers of Waters distilled, both which have a kinde of Fatnels or Oyl.

The fourth is in the Dulcoration of some Metals; as *Saccharum Saturni, &c.*

The Intension of Version of Water into a more Oily substance is by Digestion: For Oyl is almost nothing else but Water digested and this Digestion is principally by Heat; which Heat must be either outward or inward. Again, It may be by Provocation or Excitation, which is caused by the mingling of Bodies already Oily or Digested, for they will somewhat communicate their Nature with the rest. Digestion also is strongly effected by direct Assimilation of Bodies Crude into Bodies digested; as in Plants and Living Creatures, whose nourishment is far more Crude than their Bodies. But this Digestion is by a great compass as hath been said. As for the more full handling of these two principles, whereof this is but a taste; (the enquiry of which, is one of the profoundest enquiries of Nature,) we leave it to the title of Version of Bodies; and likewise to the title of the First Congregations of Matter, which like a General Assembly of Estates, doth give Law to all Bodies.

A *Chamelion* is a Creature about the bigness of an ordinary *Lizard*, his Head unproportionably big, his eyes great; he moveth his Head without the writhing of his Neck (which is inflexible) as a *Hog* doth: His Back crooked, his Skin spotted with little Tumors, less eminent nearer the Belly, his Tail slender and long; on each Foot he hath five Fingers; three on the outside, and two on the inside; his Tongue of a marvellous length, in respect of his Body, and hollow at the end, which he will lanch out to prey upon *Flies*. Of colour Green, and of a dusky Yellow, brighter and whiter towards the Belly, yet spotted with Blew, White, and Red. If he be laid upon Green, the Green predominateth; if upon Yellow, the Yellow; not so, if he be laid upon Blew, or Red, or White, onely the Green spots receive a more orient lustre; laid upon Black, he looketh all Black, though not without a mixture of Green. He feedeth not onely upon Air, (though that be his principal sustenance,) for sometimes he taketh *Flies*, as was said; yet some that have kept *Chamelions* a whole year together, could never perceive that ever they fed upon any thing else but Air, and might observe their Bellies to swell after they had exhausted the Air, and closed their Jaws, which they open commonly against the Rayes of the Sun. They have a foolish Tradition in Magick, that if a *Chamelion* be burnt upon the top of an House, it will raise a Tempest, supposing (according to their vain Dreams of Sympathies) because he nourisheth with Air, his Body should have great vertue to make impression upon the Air.

It is reported by one of the Ancients, that in part of *Media*, there are eruptions of Flames out of Plains, and that those Flames are clear, and cast not forth such smoak, and ashes, and pumice, as Mountain Flames do. The reason (no doubt) is, because the Flame is not pent, as it is in Mountains, and Earthquakes which cast Flame. There be also some blinde Fires, under

357.

Experiment
Solitary,
touching
Subterrany
Fires.

under Stone, which flame not out, but Oyl being poured upon them, they flame out. The cause whereof is, for that it seemeth the Fire is so choaked, as not able to remove the Stone, it is heat rather than flame, which nevertheless is sufficient the enflame to Oyl.

362.
Experiment
Solitary,
touching
Nitre.

IT is reported, that in some Lakes the Water is so Nitrous, as if foul Cloaths be put into it, it scoureth them of it self: And if they stay any whit long they moulder away. And the scouring Vertue of Nitre is the more to be noted, because it is a Body cold; and we see warm Water scoureth better than cold. But the cause is, for that it hath a subtil Spirit, which severeth and divideth any thing that is foul, and viscous, and sticketh upon a Body.

363.
Experiment
Solitary,
touching
Congealing of
Air.

TAKE a Bladder, the greatest you can get; full it full of Wind, and tye it about the Neck with a Silk thred waxed; and upon that likewise Wax very close; so that when the Neck of the Bladder drieth, no Air may possibly get in nor out. Then bury it three or four foot under the Earth, in a Vault, or in a Conservatory of Snow, the Snow being made hollow about the Bladder; and after some fortnights distance, see whether the Bladder be shrunk: For if it be, then it is plain, that the coldness of the Earth or Snow, hath condensed the Air, and brought it a degree nearer to Water: Which is an Experiment of great consequence.

364.
Experiment
Solitary,
touching
Congealing of
Water into
Chrystal.

IT is a report of some good credit, that in deep Caves there are Pensile Chrystal, and degrees of Chrystal that drop from above, and in some other (though more rarely) that rise from below. Which though it be chiefly the work of cold, yet it may be, that Water that passeth thorow the Earth, gathereth a Nature more clammy, and fitter to congeal, and become solid than Water of it self. Therefore tryal would be made to lay a heap of Earth in great Frosts, upon a hollow Vessel, putting a Canvase between, that it falleth not in; and pour Water upon it, in such quantity as will be sure to soak thorow, and see whether it will not make an harder Ice in the bottom of the Vessel, and less apt to dissolve than ordinarily. I suppose also, that if you make the Earth narrower at the bottom than at the top, in fashion of Sugar Loaf reversed, it will help the Experiment. For it will make the Ice, where it issueth, less in bulk; and evermore smallness of quantity is a help to Version.

365.
Experiment
Solitary,
touching
Preserving of
Rose Leaves,
both in Colour
and Smell.

TAKE Damask Roses and pull them, then dry them upon the top of an Houle, upon a Lead or Tarras in the hot Sun, in a clear day, between the hours (onely) of Twelve and two or thereabouts. Then put them into a sweet dry Earthen Bottle or a Glass with narrow mouths, stuffing them close together, but without bruising: Stop the Bottle or Glass close, and these Roses will retain, not onely their smell perfect, but their colour fresh for a year at least. Note, that nothing doth so much destroy any Plant, or other Body, either by *Putrefaction*, or *Arefaction*, as the *Adventitious Moisture*, which hangeth loose in the Body, if it be not drawn out. For it betrayeth and tolleth forth the Innate and Radicall Moisture along with it when it self goeth forth. And therefore in *Living Creatures*, moderate sweat doth preserve the Juyce of the Body. Note, that these Roses when you take them from the drying, have little

or no smell; so that the smell is a second smell that issueth out of the Flower afterwards.

THe continuance of Flame, according unto the diversity of the Body enflamed, and other circumstances, is worthy the enquiry; chiefly, for that though Flame be (almost) of a momentary lasting, yet it receiveth the More, and the Less: We will first therefore speak (at large) of Bodies enflamed, wholly, and immediately, without any Wick to help the Inflammation. A spoonful of Spirit of Wine, a little heated, was taken, and it burnt as long as came to 116 Pulses. The same quantity of Spirit of Wine, mixed with the sixth part of a spoonful of Nitre, burnt but to the space of 94 Pulses. Mixed with the like quantity of Bay-Salt 83 Pulses. Mixed with the like quantity of Gun-powder, which dissolved into a Black-water 110 Pulses. A Cube or Pellet of Yellow Wax, was taken, as much as half the Spirit of Wine, and set in the midst, and it burnt onely to the space of 87 Pulses. Mixed with the sixth part of a spoonful of Milk, it burnt to the space of 100 Pulses; and the Milk was crudled. Mixed with the sixth part of a spoonful of Water, it burnt to the space of 86 Pulses; with an equal quantity of Water, onely to the space of four Pulses. A small Pebble was laid in the midst, and the Spirit of Wine burnt to the space of 94 Pulses. A piece of Wood of the bigness of an Arrow, and about a Fingers length, was set up in the midst, and the Spirit of Wine burnt to the space of 94 Pulses. So that the Spirit of Wine Simple, endureth the longest, and the Spirit of Wine with the Bay-salt, and the equal quantity of Water, were the shortest.

Consider well, whether the more speedy going forth of the Flame, be caused by the greater vigor of the Flame in burning; or by the resistance of the Body mixed, and the aversion thereof to take Flame: Which will appear by the quantity of the Spirit of Wine, that remaineth after the going out of the Flame. And it seemeth clearly to be the latter, for that the mixture of things least apt to burn, is the speediest in going out, and note by the way, that Spirit of Wine burned, till it go out of it self, will burn no more, and tasteth nothing so hot in the mouth as it did; no nor yet sour, (as if it were a degree towards Vinegar) which burnt Wine doth, but flat and dead.

Note, that in the Experiment of Wax aforesaid, the Wax dissolved in the burning, and yet did not incorporate it self with the Spirit of Wine, to produce one Flame; but wheresoever the Wax floated, the Flame forsook it; till at last it spread all over, and put the Flame quite out.

The Experiments of the Mixtures of the Spirit of Wine enflamed, are things of discovery, and not of use: But now we will speak of the continuance of Flames, such as are used for Candles, Lamps, or Tapers, consisting of Inflammable Matters, and of a Wick that provoketh Inflammation. And this importeth not onely discovery, but also use and profit; for it is a great saving in all such Lights, if they can be made as fair and right as others, and yet last longer. Wax pure made into a Candle, and Wax mixed severally into Candle-stuff, with the particulars that follow, (*Viz. Water, Aqua-vite, Milk, Bay-salt, Oyl, Butter, Nitre, Brimstone, Sawdust,*) every of these bearing a sixth part to the Wax; and every of these Candles mixed, being of the same weight and wick, with the Wax pure, proved thus in the burning, and lasting. The swiftest in consuming was that with Sawdust, which first burned fair till some part of the Candle was consumed,

366.
Experiments
in Consort,
touching the
Continuance
of Flame.

367.

368.

369.

and

and the dust gathered about the snaffe; but then it made the snaffe big, and long, and to burn duskiſhly, and the Candle waſted in half the time of the Wax pure. The next in ſwiftness, were the Oyl and Butter, which consumed by a fifth part, swifter than the pure Wax. Then followed in swiftness the clear Wax it self; then the Bay-salt, which lasted about an eight part longer than the clear Wax; then followed the *Aqua-vita*, which lasted about a fifth part longer than the clear Wax; then follow the Milk and Water, with little difference from the *Aqua-vita*, but the Water slowest. And in these four last, the VVick would spit forth little sparks: For the Nitre, it would not hold lighted above some twelve Pulses: But all the while it would spit out portions of Flame, which afterwards would go out into a vapor. For the Brimstone, it would hold lighted much about the same with the Nitre; but then after a little while, it would harden and cake about the snaffe: So that the mixture of Bay-salt with VVax, will win an eighth part of the time of lasting, and the VVater a fifth.

370.

After the several materials were tryed, Tryal was likewise made of several VVicks; as of ordinary *Cotten*, *Sowing Thred*, *Rush*, *Silk*, *Straw*, and *Wood*. The Silk, Straw, and Wood, would flame a little, till they came to the Wax, and then go out; of the other three, the Thred consumed faster than the Cotten, by a sixth part of time; the Cotten next; then the Rush consumed slower than the Cotton, by at least a third part of time. For the bigness of the Flame, the Cotton, and Thred, cast a Flame much alike, and the Rush much less and dimmer. *Quere*, whether VVood and VVicks both, as in Torches consume faster, than the VVicks Simple?

371.

VVe have spoken of the several Materials, and the several VVicks; but to the lasting of the Flame, it importeth also, not onely, what the material is, but in the same material, whether it be hard, soft, old, new, &c. Good Houſwives to make their Candles burn the longer, use to lay them (one by one) in Bran or Flower, which make them harder, and so they consume the slower. Inſomuch, as by this means they will out-last other Candles of the same stuff, almost half in half. For Bran and Flower have a vertue to harden, so that both age, and lying in the Bran doth help to the lasting. And we see that VVax Candles last longer then Tallow-Candles, because VVax is more firm and hard.

372.

The lasting of Flame also dependeth upon the easie drawing of the Nourishment; as we see in the Court of *England*, there is a service which they call *All-Night*; which is (as it were) a great Cake of Wax, with the Wick in the midst; whereby it cometh to pass, that the Wick fetcheth the Nourishment further off. We see also, that Lamps last longer, because the Vessel is far broader than the breadth of a Taper or Candle.

373.

Take a Turreted Lamp of Tin made in the form of a Square; the height of the Turret, being thrice as much as the length of the lower part, whereupon the Lamp standeth; make onely one hole in it, at the end of the return furthest from the Turret. Reverse it, and fill it full of Oyl, by that hole; and then set it upright again, and put a Wick in at the hole, and lighten it: You shall finde that it will burn slow, and a long time: Which is caused (as was said last before) for that the Flame fetcheth the Nourishment a far off. You shall finde also, that as the Oyl wasteth and descendeth, so the top of the Turret, by little and little filleth with Air; which is caused by the Rarefaction of the Oyl by the heat. It were worthy the observation to make a hole, in the top of the Turret, and to try, when
the

the Oyl is almost consumed ; whether the Air made of the Oyl, if you put to it a flame of a Candle, in the letting of it forth, will enflame. It were good also to have the Lamp made, not of Tin, but of Glafs ; that you may see how the Vapor or Air gathereth by degrees in the top.

A fourth point, that importeth the lasting of the Flame, is the closeness of the Air, wherein the Flame burneth. We see, that if Wind bloweth upon a Candle, it wasteth apace ; we see also, it lasteth longer in a Lantern, than at large. And there are Traditions of Lamps and Candles, that have burnt a very long time in Caves and Tombs.

A fifth point, that importeth the lasting of the Flame, is the Nature of the Air where the Flame burneth ; whether it be hot or cold, moist or dry. The Air, if it be very cold, irritateth the Flame, and maketh it burn more fiercely, (as Fire scor. heth in Frosty weather) and so furthereth the Consumption. The Air once heated, (I conceive) maketh the Flame burn more mildly, and so helpeth the continuance. The Air, if it be dry, is indifferent ; the Air, if it be moist, doth in a degree quench the Flame, (as we see Lights will go out in the Damps of Mines ;) and howsoever maketh it burn more dully, and so helpeth the continuance.

Burials in Earth serve for Preservation, and for Condensation, and for Induration of Bodies. And if you intend Condensation or Induration, you may bury the Bodies so, as Earth may touch them ; as if you would make Artificial Procellane, &c. And the like you may do for Conservation, if the Bodies be hard and solid, as Clay, Wood, &c. But if you intend Preservation of Bodies, more soft and tender, then you must do one of these two : Either you must put them in cases, whereby they may not touch the Earth ; or else you must Vault the Earth, whereby it may hang over them, and not touch them : For if the Earth touch them, it will do more hurt by the moisture, causing them to putrifie, than good by the virtual cold, to conserve them, except the Earth be very dry and sandy.

An Orange, Lemmon, and Apple, wrapt in a Lining Cloth, being buried for a fortnights space four foot deep within the Earth, though it were in a moist place, and a rainy time ; yet came forth no ways mouldy or rotten, but were become a little harder than they were, otherwise fresh in their colour, but their Juyce somewhat flatted. But with the Burial of a fortnight more, they become putrified.

A Bottle of Beer buried in like manner as before, became more lively, better tasted, and clearer than it was : And a Bottle of Wine, in like manner. A Bottle of Vinegar so buried, came forth more lively and more odoriferous, smelling almost like a Violet. And after the whole Moneths Burial, all the three came forth as fresh and lively, if not better than before.

It were a profitable Experiment, to preserve Orenge, Lemmons, and Pomgranates, till Summer ; for then their price will be mightily encreased. This may be done, if you put them in a Pot or Vessel well covered, that the moisture of the Earth come not at them ; or else by putting them in a Conservatory of Snow. And generally, whosoever will make Experiments of Cold, let him be provided of three things, a Conservatory of Snow, a good large Vault, twenty foot at least under the Ground, and a deep Well.

374.

375.

376.

Experiments in Consort, touching Burials or Infusions of divers Bodies in Earth.

377.

378.

379.

380.

There hath been a Tradition, that Pearl, and Coral, Surchois-Stone, that have lost their Colours, may be recovered by burying in the Earth; which is a thing of great profit, if it would sort: But upon tryal of six weeks Burial, there followed no effect. It were good to try it in a deep Well, or in a Conservatory of Snow, where the cold may be more constringent; and so make the Body more united, and thereby more resplendent.

381.

Experiment Solitary, touching the *Affects in Mens Bodies from several Winds.*

M*ens Bodies* are heavier and less disposed to Motion when Southern Winds blow, then when Northern. The cause is, for that when the Southern Winds blow, the Humors do (in some degree) melt, and wax fluide, and so flow into the parts; as it is seen in Wood, and other Bodies, which when the Southern Winds blow, do swell. Besides, the Motion and Activity of the Body consisteth chiefly in the sinews, which, when the Southern Wind bloweth, are more relax.

382.

Experiment Solitary, touching *Winters and Summers Sicknesses.*

IT is commonly seen, that more are sick in the Summer, and more dye in the Winter; except it be in Pestilent Diseases, which commonly reign in Summer or Autumn. The reason is, because Diseases are bred (indeed) chiefly by Heat; but then they are cured most by Sweat and Purge, which in the Summer cometh on, or is provoked more easily: As for Pestilent Diseases, the Reason why most dye of them in Summer, is because they are bred most in the Summer; for otherwise, those that are touched are in most danger in the Winter.

383.

Experiment Solitary, touching *Pestilential Seasons.*

THe general opinion is, That Years hot and moist, are most Pestilent; upon the superficial Ground, that Heat and Moisture cause Putrefaction. In *England* it is found not true; for, many times, there have been great Plagues in dry years. Whereof the cause may be, for that drought in the Bodies of Islanders, habituate to moist Airs, doth exasperate the Humors, and maketh them more apt to Putrifie or Enflame; besides, it tainteth the Waters (commonly) and maketh them less wholesome. And again in *Barbary*, the Plagues break up in the Summer-Moneths, when the Weather is hot and dry.

384.

Experiment Solitary, touching *An Error received about Epidemical Diseases.*

MAny Diseases, (both Epidemical and others) break forth at particular times. And the cause is falsely imputed to the constitution of the Air, at that time, when they break forth or reign; whereas it proceedeth (indeed) from a Precedent Sequence, and Series of the Seasons of the Year: And therefore *Hippocrates*, in his Prognosticks, doth make good observations of the Diseases, that ensue upon the Nature of the precedent four Seasons of the Year.

385.

Experiment Solitary, touching the *Alteration or Preservation of Liquors in Wells, or deep Vaults.*

TRyal hath been made with Earthen Bottles, well stopped, hanged in a Well of Twenty Fathom deep, at the least; and some of the Bottles have been let down into the Water, some others have hanged above, within about a Fathom of the Water; and the Liquors so tryed have been, Beer, (not new, but ready for drinking) and Vine, and Milk. The proof hath been, that both the Beer, and the Vine, (as well within Water, as above) have not been palled or deaded at all; but as good, or somewhat better than Bottles of the same Drinks and staleness, kept in a Celler. But those which did hang above Water, were apparently the best; and that Beer did flower

flower a little; whereas that under Water did not, though it were fresh. The Milk soured, and began to putrefie. Nevertheless it is true, that there is a Village near *Blois*, where in deep Caves they do thicken Milk, in such sort, that it becometh very pleasant; which was some cause of this tryal of hanging Milk in the Well: But our proof was naught, neither do I know, whether that Milk in those Caves be first boyled. It were good therefore to try it with Milk sodder, and with Cream; for that Milk of it self, is such a Compound Body of Cream, Cruds, and Whey, as it is easily turned and dissolved. It were good also to try the Beer, when it is in Wort, that it may be seen, whether the hanging in the Well, will accelerate the ripening and clarifying of it.

Divers, we see, do Stut. The cause may be (in most) the Refrigeration of the Tongue, whereby it is less apt to move; and therefore we see, that Naturals do generally Stut: And we see, that in those that Stut, if they drink Wine moderately, they Stut less, because it heateth: And so we see, that they that Stut, do Stut more in the first offer to speak, than in continuance; because the Tongue is, by motion, somewhat heated. In some also, it may be (though rarely) the dryness of the Tongue, which likewise maketh it less apt to move as well as cold; for it is an affect that cometh to some wise and great Men, as it did unto Moses, who was *Lingua Prapedita*: And many Stutters (we finde) are very Choleric Men, Choler enducing a dryness in the Tongue.

386.
Experiment
Solitary,
touching
Stuttering.

SMells, and other Odors, are sweeter in the Air, at some distance, than near the Nose; as hath been partly touched heretofore. The cause is double. first, The finer mixture, or incorporation of the Smell. For we see, that in Sounds likewise, they are sweetest, when we cannot hear every part by it self. The other reason is, For that all sweet Smells have joynd with them some Earthy or Crude Odors; and at some distance the Sweet, which is the more spiritual, is perceived; and the Earthy reacheth not so far.

387.
Experiments
in Consort,
touching the
Smells.

Sweet Smells are most forcible in dry Substances, when they are broken; and so likewise in *Orenges* or *Lemmons*, the nipping off their Rinde, giveth out their smell more: And generally, when Bodies are moved or stirred, though not broken, they smell more, as a Sweet-Bag waved. The cause is double; the one, for that there is a greater emission of the Spirit, when way is made: And this holdeth in the Breaking, Nipping, or Crushing; it holdeth also, (in some degree) in the Moving. But in this last, there is a concurrence of the second cause, which is the Impulsion of the Air, that bringeth the sent faster upon us.

388.

The daintiest smells of Flowers, are out of those Plants whose Leaves smell not; as *Violets*, *Roses*, *Wall-flowers*, *Gilly-flowers*, *Pincks*, *Wood-bine*, *Vine-flowers*, *Apple-blooms*, *Lime-tree-blooms*, *Bean-blooms*, &c. The cause is, for that where there is heat and strength enough in the Plant to make the Leaves odorate, there the smell of the Flower is rather evanide and weaker, than that of the Leaves; as it is in *Rosemary-flowers*, *Lavender-flowers*, and *Sweet-Brier* *Roses*: But where there is less heat, there the Spirit of the Plant is digested and refined, and severed from the grosser Juyce in the Efflorescence, and not before.

389.

390.

Most Odors smell best, broken, or crushed, as hath been said ; but Flowers pressed or beaten, do lose the freshness and sweetness of their Odor. The cause is, for that when they are crushed, the grosser and more earthy Spirit cometh out with the Finer, and troubleth it ; whereas in stronger Odors there are no such degrees of the issue of the smell.

391.
Experiments
in Consort,
touching the
Goodness and
Choice of
Water.

IT is a thing of very good use, to discover the goodness of Waters. The taste to those that drink Water onely doth somewhat : But other Experiments are more sure. First, try Waters by weight, wherein you may finde some difference, though not much : And the lighter, you may account the better.

392.

Secondly, Try them by boiling upon an equal fire ; and that which consumeth away fastest, you may account the best.

393.

Thirdly, Try them in several Bottles or open Vessels, matches in every thing else, and see which of them last longest without stench or corruption ; and that which holdeth unputrified longest, you may likewise account the best.

394.

Fourthly, Try them by making Drinks, stronger or smaller, with the same quantity of Malt ; and you may conclude, that that Water, which maketh the stronger Drink, is the more concocted and nourishing ; though perhaps it be not so good for Medicinal use. And such VWater (commonly) is the VWater of large and navigable Rivers ; and likewise in large and clean Ponds of standing VWater : For upon both them, the Sun hath more power than upon Fountains, or small Rivers. And I conceive, that Chalk-water is next them the best, for going furthest in Drink. For that also helpeth concoction, so it be out of a deep VWell ; for then it cureth the rawness of the VWater ; but Chalky-water towards the top of the Earth, is too fretting, as it appeareth in Laundry of Cloaths, which wear out apace, if you use such VWaters.

395.

Fifthly, The Housewives do finde a difference in Waters, for the bearing or not bearing of Soap ; and it is likely, that the more fat water will bear Soap best, for the hungry water doth kill the unctuous nature of the Soap.

396.

Sixthly, You may make a judgment of Waters according to the place, whence they spring or come. The Rain-water is by the Physicians esteemed the finest and the best ; but yet it is said to putrifie soonest, which is likely, because of the fineness of the Spirit ; and in Conservatories of Rain-water, (such as they have in *Venice, &c*) they are found not so choice Waters ; (the worse perhaps) because they are covered aloft, and kept from the Sun. Snow-water is held unwholesome, insomuch, as the people that dwell at the Foot of the Snow Mountains, or otherwise upon the ascent, (especially the VWomen) by drinking of Snow-water, have great bags hanging under their Throats. VWell VWater, except it be upon Chalk, or a very plentiful Spring maketh Meat red, which is an ill sign. Springs on the tops of high Hills are the best ; for both they seem to have a Lightness and Appetite of Mounting ; and besides, they are most pure and unmingled : And again are more percolated through a great space of Earth. For VWaters in Valleys, joyn in effect under ground with all VWaters of the same Level ; whereas Springs on the tops of Hills, pass through a great deal of pure Earth with less mixture of other VWaters.

396.

Sevently, Judgment may be made of Waters by the Soyl whereupon the VWater runneth, as Pebble is the cleanest and best tasted ; and next to that Clay-

Clay-water; and thirdly, Water upon Chalk; Fourthly, that upon Sand; and worst of all, upon Mud. Neither may you trust *Waters* that taste sweet, for they are commonly found in Rising-grounds of great Cities, which must needs take in a great deal of filth.

IN *Peru*, and divers parts of the *West-Indies*, though under the Line, the Heats are not so intolerable, as they be in *Barbary*; and the Skirts of the *Torrid Zone*. The causes are, first, the great Brizes which the motion of the Air in great Circles (such as are under the Girdle of the World) produceth, which do refrigerate; and therefore in those parts, Noon is nothing so hot when the Brizes are great, as about nine or ten of the clock in the Forenoon. Another cause is, for that the length of the Night, and the Dews thereof, do compence the Heat of the day. A third cause is, the stay of the Sun; not in respect of day and night (for that we spake of before) but in respect of the Season: For under the Line, the Sun crosseth the Line, and maketh two Summers and two Winters; but in the skirts of the *Torrid Zone*, it doubleth and goeth back again, and so maketh one long Summer.

THe heat of the Sun maketh Men black in some Countreys, as in *Ethiopia* and *Guinny*, &c. Fire doth it not as we see in *Glass-Men*, that are continually about the Fire. The reason may be, because Fire doth lick up the Spirits and Blood of the Body, so as they exhale; so that it ever maketh Men look Pale and Sallow; but the Sun which is a gentler heat, doth but draw the Blood to the outward parts, and rather concocteth it, then soaketh it: And therefore, we see that all *Ethiopes* are fleshly, plump, and have great Lips. All which betoken moisture retained, and not drawn out. We see also, that the *Negroes* are bred in Countreys that have plenty of Water, by Rivers or otherwise: For *Mero*, which was the *Metropolis* of *Ethiopia*, was upon a great Lake; and *Congo*, where the *Negroes* are, is full of Rivers. And the confines of the River *Niger*, where the *Negroes* also are, are well watered; and the Region about *Capo Verde* is likewise moist, inso-much, as it is pestilent through moisture: But the Countreys of the *Abys-senes*, and *Barbary*, and *Peru*, where they are Tawney and Olivaster, and Pale, are generally more sandy and dry. As for the *Ethiopes*, as they are plump and fleshly, so (it may be) they are Sanguine and Ruddy coloured, if their Black Skin would suffer it to be seen.

SOME Creatures do move a good while after their head is off, as Birds. Some a very little time, as Men and all Beasts. Some move, though cut in several pieces, as Snakes, Eels, Worms, Flies, &c. First, therefore it is certain, that the immediate cause of Death, is the resolution or extinguishment of the Spirits; and that the destruction or corruption of the Organs, is but the mediate cause. But some Organs are so peremptorily necessary, that the extinguishment of the Spirits doth speedily follow; but yet so, as there is an interim of a small time. It is reported by one of the Ancients, of credit, That a Sacrificed Beast hath lived after the Heart hath been severed; and it is a report also of credit, That the Head of a Pig hath been opened, and the Brain put into the Palm of a Mans Hand, trembling, without breaking any part of it, or severing it from the Marrow of the Back-bone: during which time, the Pig hath been, in all appearance, stark dead, and without motion: And after a small time the Brain hath been replaced.

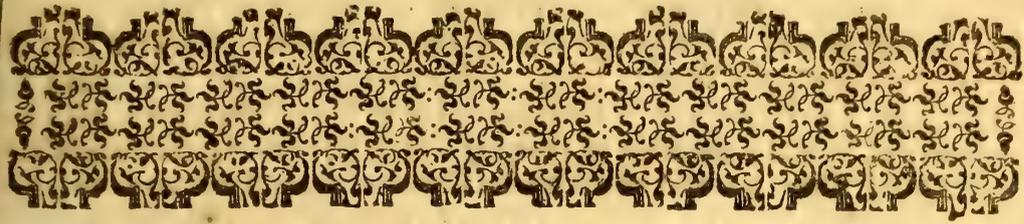

398.
Experiment Solitary, touching the Temperature Heat under the Equinoctial.

399.
Experiment Solitary, touching the Coloration of Black and Tawny Moori.

400.
Experiment Solitary, touching Motion after the Instant of Death.

and the Skull of the Pig closed, and the Pig hath a little after gone about. And certain it is, that an Eye upon Revenge, hath been thrust forth, so as it hang'd a pretty distance by the Visual Nerve; and during that time, the Eye hath been without any power of Sight; and yet after (being replaced) recovered Sight. Now the *Spirits* are chiefly in the Head, and Cells of the Brain, which in Men and Beasts are large; and therefore, when the Head is off, they move little or nothing: But Birds have small Heads, and therefore the *Spirits* are a little more dispersed in the Sinews, whereby Motion remaineth in them a little longer; insomuch, as it is extant in story, that an Emperor of *Rome*, to shew the certainty of his hand, did shoot a great Forked Arrow at an *Estrich*, as she ran swiftly upon the Stage, and stroke off her Head; and yet she continued the race a little way with her Head off. As for Worms, and Flies, and Eels, the *Spirits* are diffused almost all over; and therefore they move in their several pieces.

NATURAL HISTORY.

Century V.

E will now enquire of *Plants or Vegetables*; and we shall do it with diligence. They are the principal part of the *Third days Work*; they are the first *Product*, which is the word of *Animation*, for the other words are but the words of *Essence*; and they are of excellent and general use, For *Food*, *Medicine*, and a number of *Medicinal Arts*.

Experiments
in Consort,
touching the
Acceleration
of *Germination*.

There were sown in a Bed, *Turnip seed*, *Raddish-seed*, *Wheat*, *Cucumber-seed*, and *Pease*. The Bed we call a *Hot-bed*, and the manner of it is this. There was taken *Horse-dung*, old, and well rotted; this was laid upon a Bank half a foot high, and supported round about with Planks; and upon the top was cast sifted Earth, some two fingers deep; and then the Seed sprinkled upon it, having been steeped all night in Water mixed with *Cow-dung*. The *Turnip-seed*, and the *Wheat*, came up half an inch above ground, within two days after, without any watering; the rest the third day. The Experiment was made in *October*, and (it may be) in the *Spring*, the *Accelerating* would have been the speedier. This is a noble Experiment; for, without this help, they would have been four times as long in coming up. But there doth not occur to me, at this present, any use thereof, for profit, except it should be for *Sowing of Pease*; which have their price very much increased by the early coming. It may be tryed also with *Cherries*, *Strawberries*, and other Fruit which are dearest, when they come early.

401.

There was *Wheat* steeped in Water mixed with *Cow-dung*, other in Water mixed with *Horse-dung*, other in Water mixed with *Pigeon-dung*, other

402.

other in Urine of Man, other in Water mixed with Chalk powdered, other in Water mixed with Soot, other in Water mixed with Ashes, other in Water mixed with Bay-Salt, other in Claret Wine, other in Malmsey, other in Spirit of Wine. The proportion of the mixture was, a fourth part of the ingredients to the Water, save that there was not of the Salt above an eighth part. The Urine, and Winds, and Spirit of Wine, were simple without mixture of Water; the time of steeping was twelve hours; the time of the year *October*. There was also other Wheat sown unsteeped, but watered twice a day with warm Water; there was also other Wheat sown simple, to compare it with the rest. The event was, that those that were in the mixture of Dung, and Urine, Soot, Chalk, Ashes, and Salt, came up within six days; and those that afterwards proved the highest, thickest, and most lusty, were, first the Urine, and then the Dungs; next the Chalk, next the Soot, next the Ashes, next the Salt, next the Wheat simple of it self unsteeped and unwatered, next the watered twice a day with warm Water, next the Claret Wine. So that these three last were slower than the ordinary Wheat of it self; and this Culture did rather retard than advance. As for those that were steeped in Malmsey, and Spirit of Wine, they came not up at all. This is a rich Experiment for profit; for the most of the steepings are cheap things, and the goodness of the crop is a great matter of gain; if the goodness of the crop answer the earliness of the coming up, as it is like it will, both being from the vigor of the Seed; which also partly appeared in the former Experiment, as hath been said. This Experiment would be tryed in other Grains, Seeds, and Kernels; for it may be some steeping will agree best with some Seeds. It would be also tryed with Roots steeped as before, but for longer time; it would be tryed also in several seasons of the Year, especially in the Spring.

403.

Strawberries watered now and then (as once in three days) with Water, wherein hath been steeped Sheeps-dung, or Pigeons-dung, will prevent and come early. And it is like the same effect would follow in other *Berries, Herbs, Flowers, Grains, or Trees*; and therefore it is an Experiment, though vulgar in *Strawberries*, yet not brought into use generally: For it is usual to help the Ground with Muck, and likewise to recomfort it sometimes with Muck put to the Roots, but to water it with Muck-water, which is like to be more forcible, is not practised.

404.

Dung, or Chalk, or Blood, applied in substance (seasonably) to the Roots of Trees, doth set them forwards. But to do it unto *Herbs*, without mixture of Water or Earth, it may be these helps are too hot.

405.

The former means of helping Germination, are either by the goodness and strength of the Nourishment, or by the comforting and exciting the Spirits in the Plant, to draw the Nourishment better. And of this latter kinde concerning the comforting of the Spirits of the Plant, are also the experiments that follow; though they be not applications to the Root or Seed. The planting of Trees warm upon a Wall, against the South or South-East Sun, doth hasten their coming on and ripening; and the South-East is found to be better than the South-West, though the South-West be the hotter Coast. But the cause is chiefly, for that the heat of the morning succeedeth the cold of the night; and partly, because (many times) the South-West Sun is too parching. So likewise planting of them upon the Back of a Chimney where a fire is kept, doth hasten their coming on, and ripening: Nay more, the drawing of the Boughs into the inside of a room, where a Fire is continually kept, worketh the same effect; which

hath

hath been tryed with Grapes; insomuch, as they will come a Moneth earlier, then the Grapes abroad.

Besides the two Means of Accelerating Germination, formerly described; that is to say, the mending of the Nourishment, comforting of the Spirit of the Plant; there is a third, which is the making way for the easie coming to the Nourishment, and drawing it. And therefore gentle digging and loosning of the Earth about the Roots of Trees, and the removing Herbs and Flowers into new Earth, once in two years (which is the same thing, for the new Earth is ever looser) doth greatly further the prospering and earliness of Plants.

But the most admirable Acceleration by facilitating the Nourishment, is that of Water. For a Standard of a *Damask Rose* with the Root on, was set in a Chamber, where no Fire was, upright in an Earthen Pan, full of fair Water, without any mixture, half a foot under the Water, the Standard being more than two foot high above the Water. Within, in the space of ten days, the Standard did put forth a fair green Leaf, and some other little Buds, which stood at a stay without any shew of decay or withering, more then seven days. But afterwards that Leaf faded, but the young Buds did sprout on, which afterward opened into fair Leaves, in the space of three Moneths, and continued so a while after, till upon removal we left the tryal. But note, that the Leaves were somewhat paler, and light-coloured then the Leaves use to be abroad. Note, that the first Buds were in the end of *October*, and it is likely, that if it had been in the Spring time, it would have put forth with greater strength, and (it may) be to have grown on to bear Flowers. By this means, you may have (as it seemeth) *Roses* set in the midst of a Pool, being supported with some stay; which is matter of rareness and pleasure, though of small use. This is the more strange, for that the like *Rose* Standard was put at the same time, into Water mixed with Horse-dung, the Horse-dung about the fourth part to the Water, and in four Moneths space (while it was observed) put not forth any Leaf, though divers Buds at the first, as the other.

A *Dutch Flower* that had a *Bulbous Root*, was likewise put at the same time all under Water, some two or three fingers deep; and within seven days sprouted, and continued long after further growing. There were also put in, a *Beet-root*, a *Borrag-root*, and a *Raddish-root*, which had all their Leaves cut almost close to the Roots; and within six weeks had fair Leaves, and so continued till the end of *November*.

Note, that if Roots, or Pease, or Flowers may be accelerated in their coming and ripening, there is a double profit; the one in the high price that those things bear when they come early; the other in the swiftness of their returns: For in some Grounds which are strong you shall have a *Raddish*, &c. come in a moneth, that in other Grounds will not come in two, and so make double returns.

Wheat also was put into the Water, and came not forth at all; so as it seemeth there must be some strength and bulk in the Body, put into the Water, as it is in Roots; for Grains, or Seeds, the cold of the Water will mortifie. But casuallly some Wheat lay under the Pan, which was somewhat moistened by the suing of the Pan, which in six weeks (as aforesaid) looked mouldy to the eye, but it was sprouted forth half a fingers length.

It seemeth by these Instances of Water, that for nourishment the Water is almost all in all, and that the Earth doth but keep the Plant upright, and save it from over-heat, and over-cold; and therefore is a comfortable Experiment for good Drinkers. It proveth also that our former opinion, that

Drink

406.

407.

408.

409.

410.

411.

Drink incorporate with Flesh or Roots (as in *Capon-Beer, &c.*) will nourish more easily than Meat and Drink taken severally.

412.

The Housing of Plants (I conceive) will both Accelerate Germination, and bring forth Flowers and Plants in the colder Seasons: And as we House-hot Countrey Plants, as *Lemmons, Oranges, Myrtles*, to save them; so we may House our own Countrey Plants to forward them, and make them come in the cold Seasons, in such sort, that you may have *Violets, Strawberries, Pease*, all Winter: So that you sow or remove them at fit times. This Experiment is to be referred unto the comforting of the Spirit of the Plant by warmth, as well as Housing their Boughs, &c. So then the means to Accelerate Germination, are in particular eight, in general three.

413.
Experiments
in Confort,
touching the
Putting back
or Retardation
of Germina-
tion.

TO make *Roses* or other *Flowers* come late, it is an Experiment of Pleasure. For the Ancients esteemed much of *Rosa Sera*, and indeed the *November Rose* is the sweetest, having been less exhiled by the Sun. The Means are these, First, The cutting off their tops immediately after they have done bearing, and then they will come again the same year about *November*; but they will not come just on the tops where they were cut, but out of those Shoots which were (as it were) Water-boughs. The cause is, for that the Sap, which otherwise would have fed the top, (though after bearing) will, by the discharge of that, divert unto the Side-sprouts, and they will come to bear, but later.

414.

The second is the *Pulling of the Buds of the Rose*, when they are newly knotted, for then the side Branches will bear. The cause is the same with the former: For *cutting off the Tops, and pulling off the Buds*, work the same effect, in Retention of the Sap for a time, and Diverfion of it to the Sprouts that were not so forward.

415.

The third is the cutting off some few of the Top-boughs in the Spring time but suffering the lower Boughs to grow on. The cause is, for that the Boughs do help to draw up the Sap more strongly; and we see that in Pouling of Trees, many do use to leave a Bough or two on the top to help to draw up the Sap. And it is reported also, That if you graft upon the Bough of a Tree, and cut off some of the old Boughs, the new Cions will perish.

416.

The fourth is by laying the Roots bare about *Christmas* some days. The cause is plain, for that it doth arrest the Sap from going upwards for a time; which arrest, is afterwards released by the covering of the Root again with Earth, and then the Sap getteth up, but later.

417.

The fifth is the removing of the Tree some Moneth before it Buddeth. The cause is, for that some time will be required after the Remove, for the Resetling, before it can draw the Juyce; and that time being lost, the blossom must needs come forth later.

418.

The sixth is the Grafting of *Roses* in *May*, which commonly Gardiners do not till *July*, and then they bear not till the next year; but if you graft them in *May*, they will bear the same year, but late.

419.

The seventh is the Girding of the Body of the Tree about with some Packthred; for that also in a degree restraineth the Sap, and maketh it come up more late, and more slowly.

420.

The eighth is the Planting of them in a Shade or in a Hedge. The cause is, partly the keeping out of the Sun, which hastneth the Sap to rise, and partly the robbing of them of Nourishment by the stuff in the Hedge; these

these means may be practised upon other, both Trees, and Flowers, *Mutatis mutandis.*

Men have entertained a conceit that sheweth prettily, namely, That if you graft a Late-coming-Fruit, upon a Stock of a Fruit-tree that cometh early, the Graft will bear Fruit early, as a Peach upon a Cherry: And contrariwise, if an Early-coming-Fruit upon a Stock of a Fruit-tree that cometh late, the Graft will bear Fruit late; as a Cherry upon a Peach. But these are but imaginations, and untrue. The cause is, for that the Cions over-ruleth the Stock quite, and the Stock is but Passive onely, and giveth Aliment, but no Motion to the Graft.

421.

WE will speak now, how to make *Fruits, Flowers, and Roots* larger, in more plenty and sweeter than they use to be; and how to make the *Trees* themselves more tall, more spread, and more hasty and sudden, than they use to be. Wherein there is no doubt, but the former *Experiments of Acceleration* will serve much to these purposes. And again, that these *Experiments* which we shall now set down, do serve also for *Acceleration*, because both Effects proceeds from the encrease of *Vigor* in the Tree; but yet to avoid confusion. And because some of the Means are more proper for the one effect, and some for the other. We will handle them apart.

Experiments in Consort, touching the Melioration of Fruit-Trees, and Plants.

It is an assured Experience, That an heap of Flint or Stone, laid about the bottom of a wilde Tree, (as in Oak, Elm, Ash, &c.) upon the first planting, doth make it prosper double as much as without it. The cause is, for that it retaineth the moisture which falleth at any time upon the Tree, and suffereth it not to be exhaled by the Sun. Again, it keepeth the Tree warm from cold Blasts and Frosts, as it were in an Houle. It may be also, there is somewhat in the keeping of it steady at the first. *Quere*, if laying of Straw some height about the Body of a Tree, will not make the Tree forwards: For though the Root giveth the Sap, yet it is the Body that draweth it. But you must note, that if you lay Stones about the Stalk of Lettuce, or other Plants that are more soft, it will over-moisten the Roots, so as the *Worms* will eat them.

422.

A Tree at the first setting, should not be shaken, until it hath taken Root fully; And therefore some have put too little Forks about the bottom of their Trees, to keep them upright; but after a years rooting, then shaking doth the Tree good by loosning of the Earth, and (perhaps) by exercising (as it were) and stirring the Sap of the Tree.

423

Generally, the cutting away of Boughs and Suckers at the Root and Body, doth make Trees grow high; and contrariwise, the Poling and Cutting of the top, maketh them grow, spread, and bushy; as we see in Pol-lords, &c.

424.

It is reported, That to make hasty growing Coppice-wood, the way is, to take Willow, Sallow, Popler, Alder, of some seven years growth; and to set them, not upright, but a-slope, a reasonable depth under the Ground; and then instead of one Root they will put forth many, and so carry more shoots upon a Stem.

425.

When you would have many new Roots of Fruit-Trees, take a low Tree, and bow it, and lay all his Branches a flat upon the ground, and cast Earth upon them, and every twig will take Root. And this is a very profitable Experiment for costly Trees; (for the Boughs will make Stocks without charge) such as are *Apricots, Peaches, Almonds, Cornelians, Mulberries, Figs,* &c.

426.

&c. The like is continually practised with Vines, Roses, Musk-Roses, &c.

427. From *May* to *July* you may take off the Bark of any Bough, being of the bigness of Three or four Inches, and cover the bare place, somewhat above and below with Loam, well tempered with Horse-dung, binding it fast down. Then cut off the Bough about *Alhollantide* in the bare place, and set it in Ground, and it will grow to be a fair Tree in one year. The cause may be, for that the Bearing from the Bark, keepeth the Sap from descending towards Winter, and so holdeth it in the Bough; and it may be also, that Loam and Horse-dung applied to the bare place, do moisten it and cherish it, and make it more apt to put forth the Root. Note, that this may be a general means for keeping up the Sap of Trees in their Boughs, which may serve to other effects.

428. It hath been practised in Trees that shew fair and bear not, to bore a hole thorow the Heart of the Tree, and thereupon it will bear. Which may be, for that the Tree before hath too much Repletion, and was oppressed with his own Sap; for Repletion is an enemy to Generation.

429. It hath been practised in Trees that do not bear, to cleave two or three of the chief Roots, and to put into the Cleft a small Pebble which may keep it open, and then it will bear. The cause may be, for that a Root of a Tree may be (as it were) hide-bound, no less then the Body of the Tree; but it will not keep open without somewhat put into it.

430. It is usually practised to set Trees that require much Sun, upon Walls against the South; as *Apricots, Peaches, Plumbs, Vines, Figs*, and the like. It hath a double commodity; the one, the heat of the Wall by reflexion; the other, the taking away of the shade: For when a Tree groweth round, the upper Boughs over shadow the lower, but when it is spread upon a Wall, the Sun cometh alike upon the upper and lower Branches.

431. It hath also been practised (by some) to pull some Leaves from the Trees so spread, that the Sun may come upon the Bough and Fruit the better. There hath been practised also a curiosity, to set a Tree upon the North side of a Wall, and at a little height, to draw him through the Wall, and spread him upon the South side; conceiving, that the Root and lower part of the Stock should enjoy the freshness of the shade, and the upper Boughs and Fruit, the comfort of the Sun; but it sorted not. The cause is, for that the Root requireth some comfort from the Sun, though under Earth, as well as the Body; and the lower part of the Body more than the upper, as we see in compassing a Tree below with straw.

432. The lowness of the Bough, where the Fruit cometh, maketh the Fruit greater, and to ripen better; for you shall ever see in *Apricotes, Peaches*, or *Melo-Corones* upon a Wall, the greatest Fruits towards the bottom. And in *France* the Grapes that make the Wine, grow upon the low Vines, bound to small Stakes; and the raised Vines in Arbors, make but Verjuyce. It is true, that in *Italy*, and other Countreys where they have hotter Sun, they raise them upon Elms and Trees: But I conceive, that if the French manner of Planting low, were brought in use, their Wines would be stronger and sweeter: But it is more chargeable in respect of the Props. It were good to try whether a Tree grafted somewhat near the ground, and the lower Boughs onely maintained, and the higher continually proyned off, would not make a larger Fruit.

433. To have Fruit in greater Plenty, the way is to graft, not onely upon young Stocks, but upon divers Boughs of an old Tree; for they will bear great

great numbers of Fruit; whereas if you graft but upon one Stock, the Tree can bear but few.

The digging yearly about the Roots of Trees, which is a great means, both to the Acceleration and Melioration of Fruits, is practised in nothing but in Vines; which, if it were transferred unto other Trees and Shrubs, (as Roses, &c.) I conceive, would advance them likewise.

434.

It hath been known, that a Fruit-tree hath been blown up (almost) by the Roots, and set up again, and the next year bare exceedingly. The cause of this was nothing but the loosening of the Earth, which comforteth any Tree, and is fit to be practised more than it is in Fruit-trees: For Trees cannot be so fitly removed into new Grounds, as Flowers and Herbs may.

435.

To revive an old Tree, the digging of it about the Roots, and applying new Mould to the Roots, is the way. We see also that Draught-Oxen put into fresh Pasture, gather new and tender flesh; and in all things, better nourishment than hath been used, doth help to renew, especially, if it be not onely better but changed, and differing from the former.

436.

If an Herb be cut off from the Roots in the beginning of Winter, and then the Earth be trodden and beaten down hard with the Foot and Spade, the Roots will become of very great magnitude in Summer. The reason is, for that the moisture being forbidden to come up in the Plant, stayeth longer in the Root, and so dilateth it. And Gardiners use to tread down any loose Ground after they have sown Onions, or Turnips, &c.

437.

If *Panicum* be laid below, and about the bottom of a Root, it will cause the Root to grow to an excessive bigness. The cause is, for that being it self of a spongy substance, it draweth the moisture of the Earth to it, and so feedeth the Root. This is of greatest use for Onions, Turnips, Parsnips, and Carrots.

438.

The shifting of Ground is a means to better the Tree and Fruit; but with this Caution, That all things do prosper best, when they are advanced to the better. Your Nursery of Stocks ought to be in a more barren Ground, than the Ground is whereunto you remove them. So all *Grassiers* prefer their Cattle from meaner Pastures to better. We see also, that hardness in youth lengthneth life, because it leaveth a cherishing to the better of the Body in Age: Nay, in exercises it is good to begin with the hardest, as Dancing in thick Shoes, &c.

439.

It hath been observed that hacking of Trees in their Bark, both down-right, and a cross, so as you make them rather in slices, than in continued Hacks, doth great good to Trees, and especially delivereth them from being Hide-bound, and killeth their Moles.

440.

Shade to some Plants conduceth to make them large and prosperous more than Sun; as in Strawberries, and Bays, &c. Therefore amongst Strawberries, sow here and there some Borrage-Seed; and you shall finde the Strawberries under those Leaves, far more large than their fellows. And Bays you must plant to the North, or defend them from the Sun by a Hedg Row; and when you sow the Berries, weed not the Borders for the first half year; for the Weed giveth them Shade.

441.

To increase the Crops of Plants, there would be considered, not onely the increasing the Lust of the Earth, or of the Plant, but the saving also of that which is spilt. So they have lately made a tryal to set VVheat; which nevertheless hath been left off, because of the trouble and pains; yet so much is true, that there is much saved by the Setting, in comparison of that

442.

that which is Sown; both by keeping it from being picked up by Birds, and by avoiding the shallow lying of it, whereby much that is sown, taketh no Root.

443. It is prescribed by some of the Ancients, that you take small Trees, upon which Figs or other Fruit grow, being yet unripe, and cover the Trees in the middle of Autumn with Dung until the Spring, and then take them up in a warm day, and replant them in good Ground; and by that means, the former years Tree will be ripe, as by a new Birth, when other Trees of the same kinde do but blossom. But this seemeth to have no great probability.

444. It is reported, That if you take Nitre, and mingle it with Water, to the thickness of Honey, and therewith anoint the Bud, after the Vine is cut, it will sprout forth within eight days. The cause is like to be (if the Experiment be true) the opening of the Bud, and of the parts contiguous, by the Spirit of the Nitre; for Nitre is (as it were) the life of Vegetables.

445. Take Seed or Kernels of Apples, Pears, Oranges; or a Peach, or a Plum-stone, &c. And put them into a Squill, (which is like a great Onion) and they will come up much earlier than in the Earth it self. This I conceive to be as a kinde of Grafting in the Root; for as the Stock of a Graft yieldeth better prepared nourishment to the Graft, than the Crude Earth, so the Squill doth the like to the Seed; and, I suppose, the same would be done, by putting Kernels into a Turnip, or the like, save that the Squill is more vigorous and hot. It may be tryed also, with putting Onion-Seed into an Onion-Head, which thereby (perhaps) will bring forth a larger and earlier Onion.

446. The pricking of a Fruit in several places, when it is almost at his bigness, and before it ripeneth, hath been practised with success, to ripen the Fruit more suddenly. We see the example of the biting of Wasps or Worms upon Fruit (whereby it manifestly) ripeneth the sooner.

447. It is reported, That *Alga Marina* (Sea-weed) put under the Roots of Colworts, and (perhaps) of other Plants, will further their growth. The vertue (no doubt) hath relation to Salt, which is a great help to Fertility.

448. It hath been practised to cut off the Stalks of Cucumbers, immediately after their bearing close by the Earth; and then to cast a pretty quantity of Earth upon the Plant that remaineth, and they will bear the next year Fruit long before the ordinary time. The cause may be, for that the Sap goeth down the sooner, and is not spent in the Stalk or Leaf, which remaineth after the Fruit. Where note, that the Dying in the Winter, of the Roots or Plants that are Annual, seemeth to be partly caused by the over-expende of the Sap into Stalk and Leaves; which being prevented, they will superannate, if they stand warm.

449. The pulling off many of the Blossoms from a Fruit-tree, doth make the Fruit fairer. The cause is manifest, for that the Sap hath the less to nourish. And it is a common experience, That if you do not pull off some Blossoms, the first time a Tree bloometh, it will blossom it self to death.

450. It were good to try what would be the effect, if all the Blossoms were pulled from a Fruit-tree, or the Acorns and Chesnut-buds, &c. from a wilde Tree, for two years together. I suppose, that the Tree will either put forth the third year bigger, and more plentiful Fruit; or else, the same years, larger Leaves, because of the Sap stored up.

It hath been generally received, that a Plant watered with warm Water, will come up sooner and better, than with cold Water, or with Showers. But the Experiment of watering Wheat with warm Water (as hath been said) succeeded not; which may be, because the tryal was too late in the Year, viz. in the end of *October*. For the Cold then coming upon the Seed, after it was made more tender by the warm Water, might check it.

451.

There is no doubt, but that Grafting (for the most part) doth meliorate the Fruit. The cause is manifest, for that the nourishment is better prepared in the Stock, than in the Crude Earth: But yet note well, that there be some Trees that are said to come up more happily from the Kernel, than from the Graft; as the *Peach*, and *Melocotone*. The cause, I suppose to be, for that those Plants require a nourishment of great moisture; and though the nourishment of the Stock be finer, and better prepared, yet it is not so moist and plentiful, as the nourishment of the Earth. And indeed we see those Fruits are very cold Fruits in their Nature.

452.

It hath been received, that a smaller Pear grafted upon a Stock that beareth a greater Pear, will become great. But I think it is as true, as that of the Prime-Fruit upon the late Stock, and *è Controverso*, which we rejected before; for the Cions will govern. Nevertheless, it is probable enough, that if you can get a Cions to grow upon a Stock of another kinde, that is much moister than his own Stock, it may make the Fruit greater, because it will yield more plentiful nourishment, though it is like it will make the Fruit baser. But generally the grafting is upon a dryer Stock; as the Apple upon a Crab, the Pear upon a Thorn, &c. Yet it is reported, that in the *Low-Countreys* they will graft an Apple-Cions upon the Stock of a Colewort, and it will bear a great flaggy Apple; the Kernel of which, if it be set, will be a Colewort, and not an Apple. It were good to try, whether an Apple-Cions will prosper, if it be grafted upon a Sallow or upon a Poplar, or upon an Alder, or upon an Elm, or upon an Horse-Plum, which are the moistest of Trees. I have heard that it hath been tryed upon an Elm, and succeeded.

453.

It is manifest by experience, That Flowers removed, wax greater, because the nourishment is more easily come by in the loose Earth. It may be, that oft re-grafting of the same Cions, may likewise make Fruit greater; as if you take a Cions, and graft it upon a Stock the first year; and then cut it off, and graft it upon another Stock the second year, and so for a third, or fourth year, and then let it rest, it will yield afterward, when it beareth, the greater Fruit.

454.

Of Grafting, there are many Experiments Worth the noting, but those we reserve to a proper place.

It maketh Figs better, if a Fig-tree, when it beginneth to put forth Leaves, have his top cut off. The cause is plain, for that the Sap hath the less to feed, and the less way to mount: But it may be the Fig will come somewhat later, as was formerly touched. The same may be tried likewise in other Trees.

455.

It is reported, That Mulberries will be fairer, and the Tree more fruitful, if you bore the Trunk of the Tree thorow in several places, and thrust into the places bored, Wedges of some hot Trees; as *Turpentine*, *Mastick-tree*, *Guaiacum*, *Juniper*, &c. The cause may be, for that Adventive heat doth clear up the Native Juice of the Tree.

456.

It is reported, That Trees will grow greater and bear better Fruit, if you put Salt, or Lees of Wine, or Blood to the Root. The cause may be the en-

457.

creasing the Lust or Spirit of the Root: These things being more forcible than ordinary composites.

458. It is reported by one of the Ancients, that Artichoaks will be less prickly, and more tender, if the Seeds have their tops dulled or grated off upon a Stone.

459. *Herbs* will be tenderer, and fairer, if you take them out of Beds when they are newly come up, and remove them into Pots with better Earth. The remove from Bed to Bed was spoken of before; but that was in several years, this is upon the sudden. The cause is the same with other removes, formerly mentioned.

460. *Coleworts* are reported by one of the Ancients, to prosper exceedingly, and to be better tasted, if they be sometimes watered with Salt-water, and much more with Water mixed with Nitre; the Spirit of which is less Adu-
rent than Salt.

461. It is reported, That *Cucumbers* will prove more tender and dainty, if their Seeds be steeped (little) in Milk; the cause may be, for that the Seed being mollified with the Milk, will be too weak to draw the grosser Juyce of the Earth, but onely the finer. The same Experiment may be made in Artichoaks, and other Seeds, when you would take away, either their Flashiness or Bitterness. They speak also, that the like effect followeth of steeping in Water mixed with Honey; but that seemeth to me not so probable, because Honey hath too quick a Spirit.

462. It is reported, That *Cucumbers* will be less Watry, and more Melon-like, if in the Pit where you set them, you fill it (half way up) with Chaff, or small Sticks, and then power Earth upon them; for *Cucumbers*, as it seemeth, do extremly affect moisture, and over-drink themselves; which this Chaff, or Chips forbiddeth. Nay it is further reported, That if when a Cucumber is grown, you set a Pot of water about five or six inches distance from it, it will in Four and twenty hours shoot so much out as to touch the Pot; which if it be true, it is an Experiment of an higher nature than belongeth to this Title: For it discovereth Perception in Plants to move towards that which should help and comfort them, though it be at a distance. The ancient Tradition of the Vine is far more strange: It is, that if you set a stake, or prop, some distance from it, it will grow that way, which is far stranger (as is said) than the other: For that Water may work by a Sympathy of Attraction: But this of the Stake seemeth to be a reasonable discourse.

463. It hath been touched before, that Terebration of Trees doth make them prosper better. But it is found also, that it maketh the Fruit sweeter, and better. The cause is, for that notwithstanding the Terebration, they may receive Aliment sufficient, and yet no more than they can well turn, and digest; and withal do sweat out the coursest and unprofitablest Juyce, even as it is in Living Creatures; which, by moderate feeding, and exercise, and sweat, attain the soundest habit of Body.

464. As Terebration doth meliorate Fruit, so, upon the like reason, doth Letting of Plants Blood; as Pricking Vines, or other Trees, after they be of some growth, and thereby letting forth Gum or Tears, though this be not to continue, as it is in Terebration, but at some Seasons. And it is reported, that by this artifice, *Bitter Almonds* have been turned into sweet.

465. The Ancients for the Dulcorating of Fruit, do commend Swines dung above all other Dung, which may be, because of the moisture of that Beast, whereby the Excrement hath less Acrimony, for we see Swines and Pigs Flesh is the moistest of fleshes.

It is observed by some, that all Herbs wax sweeter, both in smell and taste, if after they be grown up some reasonable time, they be cut, and so you take the latter Sprout. The cause may be, for that the longer the Juice stayeth in the Root and Stalk, the better it concocteth. For one of the chief causes, why Grains, Seeds, and Fruits, are more nourishing than Leaves, is the length of time, in which they grow to Maturation. It were not amiss to keep back the Sap of Herbs, or the like, by some fit means till the end of Summer, whereby (it may be) they will be more nourishing.

466.

As Grafting doth generally advance and Meliorate Fruits, above that which they would be, if they were set of Kernels or Stones, in regard the nourishment is better concocted. So (no doubt) even in Grafting, for the same cause the choice of the Stock doth much; always provided, that it be somewhat inferior to the Cions. For otherwise it dulleth it. They commend much the Grafting of Pears, or Apples, upon a Quince.

467.

Besides the Means of Melioration of Fruits before-mentioned, it is set down as tryed, that a mixture of Bran and Swines Dung or Chaff and Swines-Dung (especially laid up together for a moneth to rot) is a very great nourisher and comforter to a Fruit-tree.

468.

It is delivered, that Onions wax greater if they be taken out of the Earth, and laid a drying twenty days, and then set again; and yet more, if the outermost Pill be taken off all over.

469.

It is delivered by some, that if one take the Bough of a low Fruit-tree, newly budded, and draw it gently, without hurting it, into an Earthen pot perforate at the bottom to let in the Plant, and then cover the Pot with Earth, it will yield a very large Fruit within the Ground. Which Experiment is nothing but potting of Plants, without removing and leaving the Fruit in the Earth. The like (they say) will be effected by an empty Pot without Earth in it, put over a Fruit, being propped up with a stake as it hangeth upon the Tree, and the better, if some few Pertusions be made in the Pot. VVherein, besides the defending of the Fruit from extremity of Sun or VVeather, some give a reason, that the Fruit loving and coveting the open Air and Sun, is invited by the Pertusions to spread and approach as near the open Air as it can, and so enlargeth in Magnitude.

470.

All Trees in high and Sandy Grounds, are to be set deep; and in VVatry Grounds more shallow. And in all Trees when they be removed (especially Fruit-trees) care ought to be taken, that the sides of the Trees be coasted, (North and South, &c.) as they stood before. The same is said also of Stone out of the Quarry, to make it more durable, though that seemeth to have less reason; because the Stone lyeth not so near the Sun, as the Tree groweth.

471.

Timber Trees in a Coppice-wood, do grow better than in an open Field; both, because they offer not to spread so much, but shoot up still in height, and chiefly, because they are defended from too much Sun and Wind, which do check the growth of all Fruit; and so (no doubt) Fruit-trees, or Vines, set upon a Wall, against the Sun, between Elbows and Buttrisses of Stone, ripen more than upon a plain Wall.

472.

It is said, that if *Potato Roots* be set in a Pot filled with Earth, and then the Pot with Earth be set likewise within the Ground, some two or three inches, the Roots will grow greater than ordinary. The cause may be, for that having Earth enough within the Pot to nourish them; and then being stopped by the bottom of the Pot from putting strings downward, they must needs grow greater in breadth and thickness. And it may be

473.

that all Seeds, Roots, potted, and so set into the Earth, will prosper the better.

474.

The cutting off the Leaves of Raddish, or other Roots, in the beginning of Winter before they wither; and covering again the Root, something high with Earth, will preserve the Root all Winter, and make it bigger in the Spring following, as hath been partly touched before. So that there is a double use of this cutting off the Leaves: For in Plants, where the Root is the Esculent, as Raddish, and Parsnips, it will make the Root the greater; and so it will do to the Heads of Onions, and where the Fruit is the Esculent, by strengthening the Root, it will make the Fruit also the greater.

475.

It is an Experiment of great pleasure to make the Leaves of shady Trees, larger than ordinary. It hath been tryed (for certain) that a Cion of a Weech Elm, grafted upon the stock of an ordinary Elm, will put forth Leaves, almost as broad as the brim of ones Hat. And it is very likely, that as in Fruit-Trees, the Graft maketh a greater Fruit; so in Trees that bear no Fruit, it will make the greater Leaves. It would be tryed therefore in Trees of that kinde chiefly; as *Birch*, *Ase*, *Willow*, and especially the *Shining Willow*, which they call *Swallow-Tail*; because of the pleasure of the Leaf.

476.

The Barrenness of Trees by accident (besides the weakness of the Soil Seed, or Root, and the injury of the Weather) coming either of their overgrowing with Moss, or their being hide bound, or their planting too deep, or by issuing of the Sap too much into the Leaves: For all these three are remedies mentioned before.

Experiments
in Consort,
touching
Compound
Fruits and
Flowers,

WE see that in Living Creatures that have Male and Female, there is copulation of several kindes, and so Compound Creatures; as the *Mule*, that is generated betwixt the *Horse* and *Ase*; and some other Compounds which we call Monsters, though more rare: And it is held, that that *Proverb*, *Africa semper aliquid Monstri parit*, cometh, for that the Fountains of Waters there being rare, divers sorts of Beasts come from several parts to drink, and so being refreshed, fall to couple, and many times with several kindes. The compounding or mixture of Kindes in Plants is not found out; which nevertheless, if it be possible is more at command than that of Living Creatures, for that their lust requireth a voluntary motion; wherefore it were one of the most notable Experiments touching Plants, to finde it out, for so you may have great variety of new Fruits, and flowers yet unknown. Grafting doth it not, that mendeth the Fruit, or doubleth the Flowers, &c. But it hath not the power to make a new Kind. For the Cions ever over-ruleth the Stock.

477.

It hath been set down by one of the Ancient, That if you take two Twigs of several Fruit Trees, and flat them on the sides, and then binde them close together, and set them in the ground, they will come up in one Stock; but yet they will put forth in their several Fruits without any commixture in the Fruit. Wherein note (by the way) that Unity of Continuance, is easier to procure, than Unity of Species. It is reported also, That Vines of Red and White Grapes, being set in the Ground, and the upper parts being flatted, and bound close together, will put forth Grapes of the several colours, upon the same Branch; and Grape-stones of several colours within the same Grape: But the more, after a year or two, the unity (as it seemeth) growing more perfect. And this will likewise help, if from the

the first uniting, they be often watered; for all moisture helpeth to Union: And it is prescribed also to binde the Bud, as soon as it cometh forth, as well as the Stock, at the least for a time.

They report, that divers Seeds put into a Clout, and laid in Earth well dunged, will put up *Plants* contiguous; which (afterwards) being bound in, their Shoots will incorporate. The like is said of *Kernels* put into a *Bottle*, with a narrow mouth, filled with Earth.

It is reported, that young *Trees* of several kinds set contiguous without any binding, and very often watered in a fruitful ground, with the very luxury of the *Trees*, will incorporate and grow together. Which seemeth to me the likeliest means that hath been propounded; for that the binding doth hinder the natural swelling of the *Tree*, which, while it is in motion, doth better unite.

THERE are many ancient and received Traditions and Observations, touching the *Sympathy* and *Antipathy* of *Plants*; for that some will thrive best growing near others, which they impute to *Sympathy*; and some worse which they impute to *Antipathy*. But these are idle and ignorant conceits, and forsake the true indication of the causes; as the most part of *Experiments*, that concern *Sympathies* and *Antipathies* do. For as to *Plants*, neither is there any such secret Friendship, or Hatred, as they imagine. And if we should be content to call it *Sympathy* and *Antipathy*, it is utterly mistaken; for their *Sympathy* is an *Antipathy*, and their *Antipathy* is a *Sympathy*: For it is thus, wheresoever one *Plant* draweth such a particular Juice out of the Earth, as it qualifyeth the Earth, so as that Juice which remaineth is fit for the other *Plant*, there the Neighborhood doth good, because the nourishments are contrary, or several: But where two *Plants* draw (much) the same Juice, there the Neighborhood hurteth; for the one deceiveth the other.

First, therefore, all *Plants* that do draw much nourishment from the Earth, and so soak the Earth, and exhaust it, hurt all things that grow by them; as great *Trees*, (especially *Ashes*) and such *Trees*, as spread their Roots near the top of the ground. So the *Colewort* is not an enemy (though that were anciently received) to the *Vine* onely; but it is an enemy to any other *Plant*, because it draweth strongly the fattest Juice of the Earth: And if it be true, that the *Vine*, when it creepeth near the *Colewort*, will turn away: This may be, because there it findeth worse nourishment; for though the Root be where it was, yet (I doubt) the *Plant* will bend as it nourisheth.

Where *Plants* are of several Natures, and draw several Juices out of the Earth, there (as hath been said) the one set by the other helpeth: As it is set down by divers of the Ancients, that *Rex* doth prosper much, and becometh stronger, if it be set by a *Fig-Tree*: Which (we conceive) is caused not by reason of Friendship, but by Extraction of contrary Juices; the one drawing Juice fit to relult sweet, the other bitter. So they have set down likewise, that a *Rose* set by *Garlick* is sweeter; which likewise may be, because the more Fetide Juice of the Earth goeth into the *Garlick*, and the more moderate into the *Rose*.

This we see manifestly, That there be certain *Corn-Flowers* which come seldom or never in other places, unless they be set, but onely amongst

478.

479.

Experiments
in Confort,
touching the
Sympathy and
Antipathy of
Plants.

480.

481.

482.

Corn: As the blew Bottle a kinde of yellow Mary-Gold, Wilde Poppey, and Eumitory. Neither can this be by reason of the culture of the Ground, by Ploughing or Furrowing, as some Herbs and Flowers will grow but in Ditches new cast, for if the ground lye fallow and untown, they will not come: So as it should seem to be the Corn that qualifieth the Earth, and prepareth it for their growth.

483. This observation if it holdeth (as it is very probable) is of great use, for the meliorating of taste in Fruits, and Esculent Herbs, and of the sent of Flowers. For I do not doubt, but if the Fig-tree do make the Rew more strong and bitter, (as the Ancients have noted) good flore of Rew planted about the Fig-tree, will make the Fig more sweet. Now the tastes that do most offend in Fruits, and Herbs, and Roots, are bitter, harsh, sour, and watrish, or flashy. It were good therefore to make the Tryals following.

484. Take Wormwood or Rew, and set it near Lettuce, or Coleflory, or Artichoak; and see whether the Lettuce, or the Coleflory, &c. become not the sweeter.

485. Take a Service-tree, or a Cornelian-tree, or an Elder-tree, which we know have Fruits of harsh and binding Juyce, and set them near a Vine or Fig-tree, and see whether the Grapes or Figs will not be the sweeter.

486. Take Cucumbers or Pumpions, and set them (here and there) amongst Musk-Melons, and see whether the Melons will not be more winy, and better tasted. Set Cucumbers (likewise) amongst Raddish, and see whether the Raddish will not be made the more biting.

487. Take Sorrel and set it amongst Rasps, and see whether the Rasps will not be the sweeter.

488. Take Common Bryar, and set it amongst Violets or Wall-flowers, and see whether it will not make the Violets or Wall-flowers sweeter, and less earthy in their smell. So set Lettuce or Cucumbers, amongst Rosemary or Bays, and see whether the Rosemary or Bays, will not be the more odate or aromatical.

489. Contrariwise, you must take heed how you set Herbs together that draw much the like Juyce. And therefore I think Rosemary will leese in sweetness, if it be set with Lavender or Bays, or the like. But yet, if you will correct the strength of an Herb, you shall do well to set other like Herbs by him, to take him down; and if you would set Tansey by Angelica, it may be the Angelica would be the weaker and fitter for mixture in perfume: And if you should set Rew by Common Wormwood, it may be, the Wormwood would turn to be liker Roman Wormwood.

490. This Axiom is of large extent; and therefore would be severed, and refined by Tryal. Neither must you expect to have a gross difference by this kinde of Culture, but onely further Perfection.

491. Tryal would be also made in Herbs, Poysonous, and Purgative, whose ill quality (perhaps) may be discharged or attempted, by setting stronger Poysons or Purgatives by them.

492. It is reported, That the Shrub called *Our Ladies Seal*, (which is a kinde of Briony) and Coleworts, set near together, one or both will die. The cause is, for that they be both great Depredators of the Earth, and one of them starveth the other. The like is said of Reed, and a Brake, both which are succulent; and therefore the one deceiveth the other. And the like of Hemlock and Rew, both which draw strong Juyces.

493. Some of the Ancients, and likewise divers of the Modern Writers, that have labored in Natural Magick, have noted a Sympathy between the Sun, Moon,

Moon, and some principal Stars, and certain Herbs, and Plants. And so they have denominated some Herbs Solar, and some Lunar, and such like toys put into great words. It is manifest, that there are some Flowers that have respect to the Sun in two kindes; the one by opening and shutting, and the other by bowing and inclining the Head. For Marygolds, Tulippas, Pimpernel, and indeed most flowers do open or spread their Leaves abroad, when the Sun shineth serene and fair: And again, (in some part) close them, or gather them inward, either toward night, or when the Sky is overcast. Of this, there needeth no such solemn Reason to be assigned, as to say, That they rejoyce at the presence of the Sun, and mourn at the absence thereof. For it is nothing else, but a little loading of the Leaves, and swelling them at the bottom, with the moisture of the Air; whereas the dry Air doth extend them. And they make it a piece of the wonder, That Garden Claver will hide the Stalk, when the Sun sheweth bright, which is nothing but a full expansion of the Leaves; for the bowing and inclining the Head, it is found in the great Flower of the Sun, in Marygolds, Wartwort, Mallow flowers, and others. The cause is somewhat more obscure than the former: But I take it to be no other, but that the part, against which the Sun beareth, waxeth more faint and flaccide in the Stalk, and thereby less able to support the Flower.

What a little Moisture will do in Vegetables, even though they be dead, and severed from the Earth, appeareth well in the Experiment of *Juglers*. They take the Beard of an Oat, which (if you mark it well) is wreathed at the bottom, and one smooth entire straw at the top. They take onely the part that is wreathed, and cut off the other, leaving the Beard half the breadth of a finger in length. Then they make a little Cross of a Quill long ways, of that part of the Quill which hath the Pith; and Cross ways of that piece of the Quill without Pith, the whole Cross being the breadth of a finger high: Then they prick the bottom where the Pith is, and therein they put the *Oaten-Beard*, leaving half of it sticking forth of the Quill: Then they take a little white Box of Wood to deceive men, as if somewhat in the Box did work the feat; in which, with a Pin, they make a little hole, enough to take Beard; but not to let the Cross sink down, but to stick: Then likewise, by way of Imposture, they make a question: As, who is the fairest Woman in the company? or who hath a Glove or Card? and cause another to name divers persons; and upon every naming, they stick the Cross in the Box, having first put it towards their Mouth, as if they charmed it, and the Cross stirreth not: But when they come to the person that they would take, as they hold the Cross to their Mouth, they touch the Beard with the tip of their Tongue, and wet it, and so stick the Cross in the Box, and then you shall see it turn finely and softly, three or four turns, which is caused by the untwining of the Beard by the moisture. You may see it more evidently if you stick the Cross between your fingers, instead of the Box: And therefore you may see, that this Motion, which is effected by so little wet, is stronger than the closing or bending of the Head of a Marygold.

It is reported by some, That the Herb called *Rosa-Solis* (whereof they make *Strong-waters*) will at the Noon-day, when the Sun shineth hot and bright, have a great Dew upon it. And therefore, that the right name is *Ros Solis*; which they impute to a delight and sympathy that it hath with the Sun. Men favor wonders. It were good first to be sure, That the Dew that is found upon it, be not the Dew of the Morning preserved, when

494.

495.

when the Dew of other *Herbs* is breathed away: For it hath a smooth and thick Leaf that doth not discharge the Dew so soon as other *Herbs*, that are more Spungy and Porous. And it may be *Purflane*, or some other Herb doth the like, and is not marked. But if it be so, that it hath more Dew at Noon than in the Morning, then sure it seemeth to be an exudation of the *Herb* it self. As *Plums* sweat when they are set into the Oven: For you will not (I hope) think, that it is like *Gideons* Fleece of Wooll, that the Dew should fall upon that, and no where else.

496. It is certain, that the *Hony-dews* are found more upon *Oak Leaves*, than upon *Ash*, or *Beech*, or the like: But whether any cause be from the Leaf it self, to concoct the Dew; or whether it be onely, that the Leaf is close and smooth (and therefore drinketh not in the Dew, but preserveth it) maybe doubted. It would be well inquired, whether *Manna* the *Drug*, doth fall but upon certain *Herbs* or *Leaves* onely. *Flowers* that have deep *Sockets*, do gather in the bottom, a kinde of *Honey*; as *Honey-Suckles* (both the *Woodbine*, and the *Trifol*) *Lillies*, and the like. And in them certainly the *Flower* beareth part with the *Dew*.

497. The Experience is, That the Froth, which they call *Woodfare*, (being like a kinde of Spittle) is found but upon certain *Herbs*, and those hot ones; as *Lavender*, *Lavender-cotton*, *Sage*, *Hyssope*, &c. Of the cause of this enquire further, for it seemeth a secret. There falleth also *Mildew* upon *Corn*, and smutteth it: But it may be, that the same falleth also upon other *Herbs*, and is not observed.

498. It were good, Tryal were made, whether the great consent between *Plants* and *Water*, which is a principal nourishment of them, will make an Attraction or Distance, and not at touch onely. Therefore take a Vessel, and in the middle of it make a false bottom of course *Canvas*; fill it with *Earth* above the *Canvas*, and let not the *Earth* be wated, then sow some good *Seeds* in that *Earth*: But under the *Canvas*, some half a foot in the bottom of the Vessel, lay a great *Sponge*, thorowly wet in *Water*, and let it lie some ten days; and see whether the *Seeds* will sprout, and the *Earth* become more moist, and the *Sponge* more dry. The Experiment formerly mentioned of the *Cucumber*, creeping to the *Pot* of *Water*, is far stranger than this.

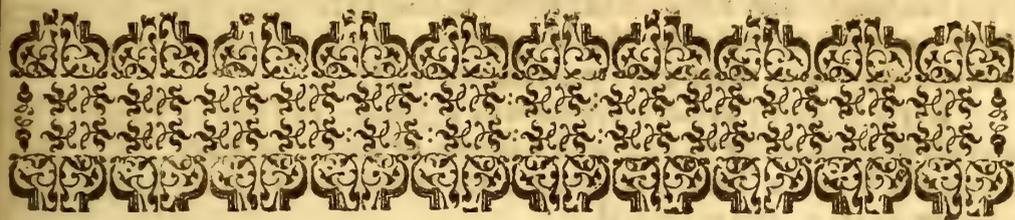

499.
Experiments
in Consort,
touching the
Making herbs
and fruits
Medicinal.

THe altering of the Sent, Colour, or Taste of Fruit, by Infusing, Mixing, or Letting into the Bark, or Root of the Tree, Herb, or Flower, any Coloured, Aromatical, or Medicinal Substance, are but fancies. The cause is, for that those things have passed their period, and nourish not; and all alteration of *Vegetables*, in those qualities, must be by somewhat that is apt to go into the nourishment of the *Plant*. But this is true, that where *Kine* feed upon *Wilde* *Garlick*, their *Milk* tasted plainly of the *Garlick*. And the *Flesh* of *Muttons* is better tasted where the *Sheep* feed upon *Wilde* *Thyme*, and other wholesome *Herbs*. *Galen* also speaketh of the curing of the *Scirr*us of the *Liver*, by *Milk* of a *Cow*, that feedeth upon certain *Herbs*, and *Honey* in *Spain* smelleth (apparently) of the *Rosemary*, or *Orange*, from whence the *Bee* gather it: And there is an old Tradition of a *Maiden* that was fed with *Napellus*, (which is counted the strongest poyson of all *Vegetables*) which with use, did not hurt the *Maid*, but poysoned some that had carnal company with her. So it is observed by some, that there is a vertuous *Bezoar*, and another without vertue, which appear to the shew alike; but the vertuous is taken from the *Beast*, that feedeth upon the *Mountains*, where there

there are Theriacel Herbs ; and that without vertue, from those that sed in the Valleys, where no such Herbs are. Thus far I am of opinion, that as steeped Wines and Beers are very Medicinal, and likewise Bread tempered with divers powders ; so of *Meat* also, (as *Flesh, Fish, Milk, and Eggs*) that they may be made of great use for Medicine and Diet, if the *Beast, Fowl, or Fish*, be fed with a special kinde of food, fit for the disease. It were a dangerous thing also for secret empoysონments. But whether it may be applied unto Plants, and Herbs, I doubt more, because the nourishment of them is a more common Juice ; which is hardly capable of any special quality until the Plant do assimilate it.

But lest our incredulity may prejudice any profitable operations in this kinde (especially since many of the Ancients have set them down) we think good briefly to propound the four Means, which they have devised of making Plants Medicinable. The first is by slitting of the Root, and infusing into it the Medicine, as *Hellebore, Opium, Scammomy, Triacle &c.* and then binding it up again. This seemeth to me the least probable, because the Root draweth immediately from the Earth, and so the nourishment is the more common and less qualified ; and besides, it is a long time in going up, ere it come to the Fruit. The second way is, to perforate the Body of the Tree, and there to infuse the Medicine, it hath the less way, and the less time to go up. The third is, the steeping of the Seed or Kernel in some Liqueur wherein the Medicine is infused ; which I have little opinion of, because the Seed (I doubt) will not draw the parts of the matter which have the propriety ; but it will be far the more likely, if you mingle the Medicine with Dung, for that the Seed, naturally drawing the moisture of the Dung, may call in withal some of the propriety. The fourth is, the Watering of the Plant oft, with an infusion of the Medicine. This, in one respect may have more force than the rest, because the Medication is oft renewed, whereas the rest are applied, but at one time ; and therefore the vertue may the sooner vanish. But still I doubt, that the Root is somewhat too stubborn to receive those fine Impressions ; and besides (as I have said before) they have a great Hill to go up. I judge therefore the likeliest way to be the perforation of the Body of the Tree, in several places, one above the other, and the filling of the Holes with Dung mingled with the Medicine. And the Watring of those Lumps of Dung, with Squirts of an Infusion of the Medicine in dunged Water, once in three or four days.

500.

NATURAL HISTORY.

Century V I.

Our Experiments we take care to be (as we have often said,) either *Experimenta Fructifera*, or *Lucifera*; either of Use, or of Discovery: For we hate Impostures; and despise Curiosities. Yet because we must apply our selves somewhat to others, we will set down some Curiosities touching Plants.

Experiments
in Consort,
touching
Curiosities
about Fruits
and Plants.

501.

It is a Curiosity to have several Fruits upon one Tree; and the more, when some of them come early, and some come late: So that you may have, upon the same Tree, ripe Fruits all Summer. This is easily done by Grafting of several Cions upon several Boughs of a Stock, in a good ground, plentifully fed. So you may have all kinds of Cherries, and all kinds of Plumbs, and Peaches, and Apricots upon one Tree: But, I conceive the Diversity of Fruits must be such, as will graft upon the same Stock. And therefore, I doubt, whether you can have Apples, or Pears, or Orenge, upon the same Stock, upon which you graft Plumbs.

It is a Curiosity to have Fruits of divers Shapes and Figures. This is easily performed by Moulding them, when the Fruit is young, with Moulds of Earth or Wood. So you may have Cucumbers, &c. as long as a Cane, or as round as a Sphere, or formed like a Cross. You may have also Apples in the form of Pears or Lemmons. You may have also Fruit in more accurate Figures; as we said of Men, Beasts, or Birds, according as you make the Moulds, wherein you must understand, that you make the Mould big enough to contain the whole Fruit, when it is grown to the greatest; for else you will choak the spreading of the Fruit, which otherwise would spread it self, and fill the Concave, and so be turned into the shape desired; as it is in Mould-works of Liquid things. Some doubt may be conceived,

502.

ceived, that the keeping of the Sun from the Fruit, may hurt it : But there is ordinary experience of Fruit that groweth covered. *Quare* also, whether some small holes may not be made in the Wood, to let in the Sun. And note, that it were best to make the Moulds partible, glued, or cemented together, that you may open them when you take out the Fruit.

503. It is a curiosity to have *Inscriptions* or *Engravings*, in Fruit or Trees. This is easily performed, by writing with a *Needle*, or *Bodkin*, or *Knife*, or the like, when the Fruit or Trees are young ; for as they grow, so the Letters will grow more large, and graphical.

— *Tenerisque meos incidere Amores*
Arboribus, crescent illa, crescent Amores.

504. You may have Trees apparelled with Flowers or Herbs by boring holes in the Bodies of them, and putting into them Earth holpen with Muck, and setting Seeds or Slips, of *Violets*, *Strawberries*, *Wilde Time*, *Camomil*, and such like in the Earth, wherein they do but grow in the Tree, as they do in Pots, though (perhaps) with some feeding from the Trees. As it would be tryed also with Shoots of *Vines*, and Roots of *Red-Roses* ; for it may be, they being of a more Ligneous Nature, will incorporate with the Tree it self.

505. It is an ordinary curiosity to form Trees and Shrubs (as *Rosemary*, *Juniper*, and the like) into sundry shapes ; which is done by moulding them within, and cutting them without. But they are but lame things, being too small to keep Figure ; great Castles made of Trees upon Frames of Timber, with Turrets and Arches, were anciently matters of magnificence.

506. Amongst curiosities, I shall place Colouration, though it be somewhat better ; for Beauty in Flowers is their pre-eminence. It is observed by some, that *Gilly-Flowers*, *Sweet-Williams*, *Violets*, that are coloured, if they be neglected, and neither Watered, nor new Moulded, nor Transplanted, will turn White. And it is probable, that the White, with much culture, may turn coloured ; for this is certain, That the white colour cometh of scarcity of Nourishment ; except in Flowers that are onely white, and admit no other colours.

507. It is good therefore to see what Natures do accompany what colours ; for by that you shall have light, how to induce colours, by producing those Natures. Whites are more inodorate (for the most part) than Flowers of the same kinde coloured ; as is found in single White *Violets*, White *Roses*, White *Gilly-Flowers*, White *Stock-Gilly-Flowers*, &c. We finde also, that Blossoms of Trees that are White, are commonly inodorate ; as *Cherries*, *Pears*, *Plums*, whereas those of *Apples*, *Crabs*, *Almonds*, and *Peaches*, are blusky, and smell sweet. The cause is, for that the substance that maketh the Flower, is of the thinnest and finest of the Plant ; which also maketh Flowers to be of so dainty Colours. And if it be too sparing and thin, it attaineth no strength of odor, except it be in such Plants as are very succulent ; whereby they need rather to be scanted in their nourishment, than replenished, to have them sweet. As we see in White *Satyron*, which is of a dainty smell ; and in *Bean-flowers*, &c. And again, if the Plant be of Nature to put forth White Flowers onely, and those not thin or dry, they are commonly of rank and fulsome smell ; as *May-Flowers* and *White Lillies*.

508. Contrariwise, in Berries, the White is commonly more delicate and sweet in taste, than the Coloured ; as we see in white *Grapes*, in white *Raspes*, in white *Strawberries*, in white *Currans*, &c. The cause is for that the

the coloured are more juyced, and courser juyced; and therefore not so well and equally concocted, but the white are better proportioned to the digestion of the *Plant*.

But in *Fruits*, the white commonly is meaner, as in *Pear-Plumbs*, *Damosins*, &c. and the choicest *Plumbs* are black; the *Mulberry*, (which though they call it a *Berry*, is a *Fruit*) is better the *Black*, than the *White*. The *Harvest White-Plumb*, is a base *Plumb*, and the *Verdaccio* and *White Date-Plumb*, are no very good *Plumbs*. The cause is, for that they are all over-watry: Whereas an higher *Concoction* is required for sweetness, or pleasure of taste; and therefore all your dainty *Plumbs*, are a little dry, and come from the *Stone*; as the *Muske-Plumb*, the *Damosin-Plumb*, the *Peach*, the *Apricot*, &c. Yet some *Fruits* which grow not to be *Black*, are of the Nature of *Berries*, sweetest such as are paler, as the *Cœur-Cherry*, which inclineth more to *White*, is sweeter than the *Red*; but the *Egricot* is more soure.

Take *Gilliflowers Seed*, of one kinde of *Gilliflowers* (as of the *Clove-Gilliflower* which is the most common) and sow it, and there will come up *Gilliflowers*, some of one colour, and some of another, casually, as the *Seed* meeteth with nourishment in the *Earth*: So that the *Gardiniers* finde, that they may have two or three *Roots* amongst an hundred that are rare, and of great price, as *Purple Carnation* of several stripes. The cause is (no doubt) that in *Earth*, though it be contiguous, and in one *Bed*, there are very several *Juyces*; and as the *Seed* doth casually meet with them, so it cometh forth. And it is noted especially, that those which do come up *Purple*, do always come up single; the *Juyce*, as it seemeth, not being able to suffice a succulent colour, and a double *Leaf*. This *Experiment* of several colours, coming up from one *Seed*, would be tryed also in *Larks-foot*, *Monk-hood*, *Poppy*, and *Hollioak*.

Few *Fruits* are coloured *Red* within; the *Queen-Apple* is, and another *Apple*, called the *Rose-Apple*; *Mulberries* likewise, and *Grapes*, though most toward the skin. There is a *Peach* also, that hath a circle of *Red* towards the stone; and the *Egricot-Cherry* is somewhat *Red* within: But no *Pear*, nor *Warden*, nor *Plumb*, nor *Apricot*, although they have (many times) *Red* sides, are coloured *Red* within. The cause may be enquired.

The general colour of *Plants* is *Green*, which is a colour that no *Flower* is of. There is a greenish *Prime-Rose*, but it is pale, and scarce a green; the *Leaves* of some *Trees* turn a little *Murrey* or *Reddish*, and they be commonly young *Leaves* that do so; as it is in *Oaks* and *Vines*. And *Hassel-Leaves* rot into a *Yellow*; and some *Hollies* had part of their *Leaves* *Yellow*, that are (to all seeming) as fresh and shining as the *Green*. I suppose also, that *Yellow* is a less succulent colour than *Green*, and a degree nearer *White*. For it hath been noted, that those *Yellow* *Leaves* of *Holly*, stand evertoward the *North* or *North-East*. Some *Roots* are *Yellow*, as *Carrots*; and some *Plants*, *Blood-red*, *Stalk* and *Leaf*, and all; as *Amaranthus*. Some *Herbs* incline to *Purple* and *Red*; as a kinde of *Sage* doth, and a kinde of *Mint*, and *Rosa Solis*, &c. And some have *White* *Leaves*, as another kinde of *Sage*, and another kinde of *Mint*: But *Azure* and a fair *Purple* are never found in *Leaves*. This sheweth, that *Flowers* are made of a refined *Juyce* of the *Earth*, and so are *Fruits*; but *Leaves* of a more course and common.

It is a curiosity also to make *Flowers* double, which is effected by often removing them into new *Earth*; as on the contrary part, double *Flowers*,

509.

510.

511.

512.

513.

by neglecting, and not removing, prove single. And the way to do it speedily, is to sow or set Seeds, or Slips of Flowers; and as soon as they come up, to remove them into new ground that is good: Enquire also, whether inoculating of Flowers, (as Stock-Gilliflowers, Roses, Musk-Roses, &c.) doth not make them double. There is a Cherry-Tree that hath double Blossoms, but that Tree beareth no Fruit; and, it may be, that the same means which applied to the Tree, doth extremely accelerate the Sap to rise and break forth, would make the Tree spend it self in Flowers, and those to become double, which were a great pleasure to see; especially in Apple-trees, Peach-trees, and Almond-trees, that have Blossoms Blush coloured.

514. The making of Fruits without Core or Stone, is likewise a curiosity, and somewhat better; because whatsoever maketh them so, is like to make them more tender and delicate. If a Cions or Shoot fit to be set in the Ground, have the Pith finely taken forth (and not altogether, but some of it left, the better to save the life) it will bear a Fruit with little or no Core or Stone. And the like is said to be of dividing a quick Tree down to the Ground, and taking out the Pith, and then binding it up again.

515. It is reported also, that a Citron grafted upon a Quince will have small or no Seeds; and it is very probable, that any sowre Fruit grafted upon a Stock that beareth a sweeter Fruit, may both make the Fruit sweeter, and more void of the harsh matter of Kernels or Seeds.

516. It is reported, that not onely the taking out of the Pith, but the stopping of the Juice of the Pith from rising in the midst, and turning it to rise on the outside, will make the Fruit without Core or Stone; as if you should bore a Tree clean thorow, and put a wedge in. It is true, there is some affinity between the Pith and the Kernel, because they are both of a harsh substance, and both placed in the midst.

517. It is reported, that Trees watered perpetually with warm Water, will make a Fruit with little or no Core or Stone. And the rule is general, That whatsoever will make a wilde Tree, a Garden Tree will make a Garden Tree to have less Core or Stone.

518.
Experiments
in Consort, touching the
Degenerating
of Plants, and
of the Trans-
mutation of
them, one into
another.

THE Rule is certain, That Plants for want of Culture, degenerate to be baser in the same kinde; and sometimes so far, as to change into another kinde. 1. The standing long, and not being removed, maketh them degenerate. 2. Drought, unless the Earth of it self be moist, doth the like. 3. So doth removing into worse Earth, or forbearing to compost the Earth; as we see, that Water-Mint turneth into Field Mint, and the Colewort into Rape by neglect, &c.

519. Whatsoever Fruit useth to be set upon a Root, or a Slip, if it be sown, will degenerate; Grapes sown, Figs, Almonds, Pomegranate Kernels sown, make the Fruits degenerate, and become wilde. And again, most of those Fruits that use to be grafted, if they be set of Kernels, or Stones degenerate. It is true, that Peaches (as hath been touched before) do better upon Stones set, than upon grafting: And the rule of Exception should seem to be this, That whatsoever Plant requireth much moisture, prospereth better upon the Stone or Kernel, than upon the Graft. For the Stock, though it giveth a finer nourishment, yet it giveth a scantier, than the Earth at large.

520. Seeds, if they be very old, and yet have strength enough to bring forth a Plant, make the Plant degenerate. And therefore skilful Gardiners make tryal of the Seeds, before they buy them, whether they be good or no, by putting them

them in Water gently boiled; and if they be good, they will sprout within half an hour.

It is strange which is reported, That *Basil* too much exposed to the Sun, doth turn into *Wilde Time*: Although those two Herbs seem to have small Affinity; but *Basil* is almost the onely hot Herb that hath fat and succulent Leaves; which Oyliness if it be drawn forth by the Sun, it is like it will make a very great change.

There is an old Tradition, that *Boughs of Oak* put into the Earth, will put forth *Wilde Vines*; which if it be true, (no doubt) it is not the *Oak* that turneth into a *Vine*, but the *Oak-bough* putrifying, qualifyeth the Earth to put forth a *Vine* of it self.

It is not impossible; and I have heard it verified, that upon cutting down of an old *Timber-Tree*, the *Stub* hath put out sometimes a *Tree* of another kinde; as that *Beech* hath put forth *Birch*: Which if it be true, the cause may be, for that the old *Stub* is too scant of *Juyce* to put forth the former *Tree*; and therefore putteth forth a *Tree* of smaller kinde; that needeth less *Nourishment*.

There is an opinion in the Country, That if the same Ground be oft sown with the *Grain* that grew upon it, it will, in the end, grow to be of a baser kinde.

It is certain, that in *Sterile Years*, *Corn* sown will grow to an other kinde.

*Grandia saepe quibus mandavimus. Hordea Sulcis,
Infelix Lolium, & steriles dominatur Avena.*

And generally it is a Rule, that *Plants* that are brought forth by *Culture*, as *Corn*, will sooner change into other *Species*, than those that come of themselves: For that *Culture* giveth but an *Adventitious Nature*, which is more easily put off.

This work of the *Transmutation of Plants*, one into another, is *inter Magnalia Natura*: For the *Transmutation of Species* is, in the vulgar *Philosophy*, pronounced impossible: And certainly, it is a thing of difficulty, and requireth deep search into *Nature*: But seeing there appear some manifest instances of it, the opinion of impossibility is to be rejected, and the means thereof to be found out. We see that in *Living Creatures*, that come of *Putrefaction*, there is much *Transmutation* of one into another. As *Caterpillers* turn into *Flies*, &c. And it should seem probable, that whatsoever *Creature* having life, is generated without *Seed*, that *Creature* will change out of one *Species* into another; for it is the *Seed*, and the *Nature* of it, which locketh and boundeth in the *Creature*, that it doth not expatiate. So as we may well conclude, that seeing the *Earth* of it self, doth put forth *Plants* without *Seed*; therefore *Plants* may well have a *Transmigration of Species*. Wherefore wanting *Instances*, which do occur, we shall give *Directions* of the most likely tryals: And generally, we would not have those that read this work of *Sylva Sylvarum*, account it strange, or think that it is an over-haste, that we have let down particulars untried: For contrariwise, in our own estimation, we account such particulars mote worthy than those that are already tryed and known. For these latter must be taken as you finde them, but the other do level point blank at the inventing of causes, and *Axioms*.

526.

First, therefore you must make account, that if you will have one Plant change into another, you must have the Nourishment over-rule the Seed : And therefore you are to practise it by Nourishments as contrary as may be, to the Nature of the Herb ; so nevertheless as the Herb may grow, and likewise with Seeds that are of the weakest sort, and have least vigor. You shall do well therefore to take Marsh Herbs, and plant them upon tops of Hills and Champaigns ; and such Plants as require much moisture, upon Sandy and very dry grounds. As for example, Marsh-Mallows, and Sedge upon Hills, Cucumber and Lettuce Seeds, and Coleworts upon a Sandy Plat ; so contrariwise plant Bushes, Heath, Ling, and Brakes upon a Wet or Marsh Ground. This I conceive also, that all Esculent and Garden Herbs, set upon the tops of Hills, will prove more *Medicinal*, though less Esculent, than they were before. And it may be likewise, some Wilde Herbs you may make Salet Herbs. This is the first Rule for Transmutation of Plants.

527.

The second Rule should be to bury some few Seeds of the Herb you would change amongst other Seeds ; and then you shall see whether the Juyce of those other Seeds do not so qualifie the Earth, as it will alter the Seed whereupon you work. As for example, Put Parsly-seed amongst Onion-seed, or Lettuce-seed amongst Parsly-seed, or Basil-seed amongst Thyme-seed, and see the change of taste or otherwise. But you shall do well to put the Seed you would change into a little Linnen Cloth, that it mingle not with the Foreign Seed.

528.

The third Rule shall be the making of some medly, or mixture of Earth, with some other Plants bruised, or shaved, either in Leaf or Root : As for example make Earth, with a mixture of Colewort Leaves stamped, and set in it Artichoaks, or Parsnips : So take Earth made with *Majoram*, or *Origannum*, or *Wilde Thyme*, bruised, or stamped, and set in it *Fennel-seed*, &c. In which operation, the Proces of Nature still will be, (as I conceive,) not that the Herb you work upon, should draw the Juyce of the Foreign Herb ; (for that opinion we have formerly rejected) but there will be a new confection of mould, which perhaps will alter the Seed, and yet not to the kinde of the former Herb.

529.

The fourth Rule shall be to mark what Herbs some Earths do put forth of themselves, and to take that Earth, and to Pot it, or to Vessel it ; and into that, set the Seed you would change : As for Example, take from under Walls, or the like ; where Nettles put forth in abundance, the Earth which you shall there finde, without any String or Root of the Nettles ; and pot that Earth ; and set in it Stock-Gilly-flowers, or Wall-flowers, &c. Or sow in the Seeds of them, and see what the event will be ; or take Earth, that you have prepared to put forth *Mushrooms* of it self, (whereof you shall finde some instances following,) and sow it in Purslane-seed, or Lettuce-seed ; for in these Experiments, it is likely enough, that the Earth being accustomed to send forth one kinde of Nourishment, will alter the new Seed.

530.

The fifth Rule shall be, to make the Herb grow contrary to his nature, as to make Ground Herbs rise in height : As for example, Carry Camomile, or Wilde Thyme, or the Green Strawberry, upon sticks, as you do Hops upon Poles, and see what the event will be.

531.

The sixth Rule shall be to make Plants grow out of the Sun, or open Air ; for that is a great mutation in Nature, and may inouce a change in the Seed : As barrel up Earth, and sow some Seed in it, and put in the bottom of a Pond, or put it in some great hollow Tree ; try also the sowing
of

of Seeds in the bottoms of Caves; and Pots with Seeds town, hanged up in Wells, some distance from the Water, and see what the event will be.

IT is certain, that *Timber-Trees* in *Coppice Woods*, grow more upright, and more free from under Boughs, than those that stand in the Fields. The cause whereof is, for that *Plants* have a natural motion to get to the Sun; and besides, they are not glutted with too much nourishment; for that the *Coppice* shareth with them, and Repletion ever hindreth stature. Lastly, they are kept warm, and that ever in *Plants* helpeth mounting.

532.
Experiments in Consort, touching the Procerity, and Lowness, and Artificial Dwarfing of Trees.

Trees that are of themselves full of Heat, (which heat appeareth by their inflammable Gums) as *Firrs*, and *Pines*, mount of themselves in height without Side-boughs, till they come towards the top. The cause is partly heat, and partly tenuity of Juyce; both which send the Sap upwards. As for *Juniper*, it is but a *Shrub*, and groweth not big enough in Body to maintain a tall Tree.

533.

It is reported, that a good strong Canvas, spred over a Tree grafted low, soon after it putteth forth, will dwarf it, and make it spred. The cause is plain; for that all things that grow, will grow as they finde room.

534.

Trees are generally set of *Roots* or *Kernels*; but if you set them of *Slips*, (as of some *Trees* you may, by name the *Mulberry*) some of the *Slips* will take; and those that take, (as is reported) will be *Dwarf-trees*. The cause is, for that a *Slip* draweth nourishment more weakly, than either a *Root* or *Kernel*.

535.

All *Plants* that put forth their Sap hastily, have their Bodies not proportionable to their length, and therefore they are *Winders* and *Creepers*; as *Ivy*, *Briony*, *Hops*, *Woodbine*: Whereas *Dwarfing* requirerh a slow putting forth, and less vigor of mounting.

536.

THe Scripture saith, That *Solomon* wrote a Natural History, from the *Cedar of Libanus*, to the *Moss* growing upon the Wall; for so the best *Translations* have it. And it is true, that *Moss* is but the *Rudiment* of a *Plant*, and (as it were) the *Mould* of *Earth* or *Bark*.

Experiments in Consort, touching the Rudiments of Plants, and of the Excrecences of Plants, or Super-Plants.

Moss groweth chiefly upon *Ridges* of *Houses*, tiled or thatched, and upon the *Crests* of *Walls*, and that *Moss* is of a lightsome and pleasant Green. The growing upon *Slopes* is caused for that *Moss*, as on the one side it cometh of *Moisture* and *Water*, so on the other side the *Water* must but slide, and not stand or pool. And the growing upon *Tiles*, or *Walls*, &c. is caused, for that those dried *Earths*, having not moisture sufficient to put forth a *Plant*, do practice *Germination* by putting forth *Moss*; though when by age, or otherwise, they grow to relent and resolve, they sometimes put forth *Plants*, as *Wall-flowers*. And almost all *Moss* hath here and there little *Stalks*, besides the low *Thrum*.

537.

Moss groweth upon *Alleys*, especially such as lye cold, and upon the *North*; as in divers *Tarrases*. And again, if they be much trodden; or if they were at the first gravelled: For wheresoever *Plants* are kept down, the *Earth* putteth forth *Moss*.

538.

539. Old Ground, that hath been long unbroken up, gathereth Moſs; and therefore Husbandmen uſe to cure their Paſture-Grounds, when they grow to Moſs, by Tilling them for a year, or two: Which alſo dependeth upon the ſame cauſe; for that the more ſparing and ſtarving Juyce of the Earth, inſufficient for Plants, doth breed Moſs.
540. Old Trees are more Moſſie, (far) than young; for that the Sap is not ſo frank as to riſe all to the Boughs, but tireth by the way, and putteth out Moſs.
541. Fountains have Moſs growing upon the Ground about them;
Muſcoſi Fontes—————
- The cauſe is, for that the Fountains drain the Water from the Ground adjacent, and leave but ſufficient moiſture to breed Moſs; and beſides, the coldneſs of the Water conduceth to the ſame.
542. The Moſs of Trees, is a kinde of Hair; for it is the Juyce of the Tree, that is excerned, and doth not aſſimilate, and upon great Trees the Moſs gathereth a figure, like a Leaf.
543. The moiſture ſort of Trees yield little Moſs, as we ſee in *Aſps, Poplars, Willows, Beeches, &c.* Which is partly cauſed for the reaſon that hath been given of the frank putting up of the Sap into the Boughs; and partly, for that the Barks of thoſe Trees are more cloſe and ſmooth, than thoſe of Oaks, and Aſhes, whereby the Moſs can the hardlier iſſue out.
544. In Clay Grounds, all Fruit Trees grow full of Moſs, both upon Body and Boughs; which is cauſed, partly by the coldneſs of the Ground, whereby the Plants nourish leſs; and partly by the toughneſs of the Earth, whereby the Sap is ſhut in, and cannot get up, to ſpred ſo frankly as it ſhould do.
545. We have ſaid heretofore, that if Trees be hide-bound, they wax leſs fruitful and gather Moſs; and that they are holpen by hacking, &c. And therefore by the reaſon of contraries, if Trees be bound in with Cords or ſome outward Bands, they will put forth more Moſs: Which (I think) hapneth to Trees that ſtand bleak, and upon the cold Winds. It would alſo be tried, whether, if you cover a Tree, ſomewhat thick upon the top, after his powling, it will not gather more Moſs. I think alſo, the Waring of Trees with cold Fountain Water will make them grow full of Moſs.
546. There is a Moſs the *Perfumers* have, which cometh out of Apple-Trees, that hath an excellent ſent. *Quare*, particularly for the manner of the growth, and the nature of it. And for this Experiments ſake, being a thing of price, I have ſet down the laſt Experiments, how to multiply and call on Moſſes.
- Next unto Moſs, I will ſpeak of *Muſhromes*, which are likewise an unperfect Plant. The *Muſhromes* have two ſtrange properties; the one, that they yield ſo delicious a Meat; the other, that they come up ſo haſtily, as in a night, and yet they are untown. And therefore ſuch as are Upstarts in State, they call in reproach, *Muſhromes*. It muſt needs be therefore, that they be made of much moiſture; and that moiſture fat, groſs, and yet ſomewhat concocted. And (indeed) we finde, that *Muſhromes* cauſe the accident, which we call *Incubus*, or the *Mare* in the Stomach. And therefore the Surfeit of them may ſuffocate and empoyſon. And this ſheweth, that they are windy; and that windineſs is groſs, and ſwelling, not ſharp or griping. And upon the ſame reaſon *Muſhromes* are a venereous Meat.

It is reported, that the Bark of white or Red Poplar, (which are of the moistest of Trees) cut small, and cast into Furrows well dunged, will cause the ground to put forth *Mushromes*, at all seasons of the year fit to be eaten, some add to the mixture Leaven of Bread, resolved in Water.

547.

It is reported, that if a Hilly-field, where the stubble is standing, be set on fire, in the showry season, it will put forth great store of *Mushromes*.

548.

It is reported, that *Harts-Horn* shaken, or in small pieces, mixed with Dung, and watred, putteth up *Mushromes*. And we know that *Harts-Horn* is of a fat and clammy substance: And it may be *Ox-Horn* would do the like.

549.

It hath been reported, though it be scarce credible, that Ivy hath grown out of a *Stags-Horn*; which they suppose did rather come from a confrication of the Horn upon the Ivy, than from the Horn it self. There is not known any substance, but Earth, and the Proceedurs of Earth, (as *Tile-Stone, &c.*) that yieldeth any Moiss, or Herby substance. There may be tryal made of some Seeds, as that Fennel-Seed, Mustard-Seed, and Rape-Seed, put into some little holes made in the Horns of Stags, or Oxen, to see if they will grow.

550.

There is also another unperfect Plant, that (in shew) is like a great Mushrome: And it is sometimes as broad as ones Hat, which they call a *Toads-stool*; but it is not Esculent, and it groweth (commonly) by a dead Stub of a Tree, and likewise about the Roots of rotten Trees; and therefore seemeth to take his Juyce from Wood putrified. Which sheweth by the way, that Wood putrified yieldeth a frank moisture.

551.

There is a Cake that groweth upon the side of a dead Tree, that hath gotten no name, but it is large and of a Chesnut colour. and hard and pithy; whereby it should seem, that even dead Trees forget not their putting forth, no more than the Carcasses of Mens Bodies that put forth Hair and Nails for a time.

552.

There is a Cod or Bag that groweth commonly in the Fields; that at first is hard like a Tennis-Ball, and white; and after growth of a Mushrome colour, and full of light dust upon the breaking; and is thought to be dangerous for the eyes, if the Powder get into them, and to be good for Kibes. Belike it hath a Corrosive, and fretting Nature.

553.

There is an Herb called *Jews-Ear*, that groweth upon the Roots, and lower parts of the Bodies of Trees, especially of Elders, and sometimes Ashes. It hath a strange propriety; for in warm Water, it swelleth, and openeth extremely. It is not green; but of a dusky brown colour. And it is used for squinancies, and inflamations in the Throat, whereby it seemeth to have a mollifying, and lenifying vertue.

554.

There is a kinde of Spongy excrecence, which groweth chiefly upon the Roots of the Laser-Tree, and sometimes upon Cedar, and other Trees. It is very white, and light, and fryable; which we call *Agarick*. It is famous in Physick for the purging of tough Flegm. And it is also an excellent opener for the Liver, but offensive to the Stomach; and in taste it is, at the first sweet and after bitter.

555.

We finde no Super-Plant, that is a formed Plant, but *Misseltoe*. They have an idle Tradition, that there is a Bird called a *Missel-Bird*, that feedeth upon a Seed, which many times she cannot digest, and so expelleth it whole with her Excrement; which falling upon a Bough of a Tree, that hath some rift, putteth forth *Misseltoe*. But this is a Fable; for it is not probable, that Birds should feed upon that they cannot digest. But allow that,

556.

that,

that, yet it cannot be for other Reasons: For first, it is found but upon certain Trees; and those Trees bear no such Fruit, as may allure that Bird to sit and feed upon them. It may be, that Bird feedeth upon the Mistletoe-Berries, and so is often found there; which may have given occasion to the tale. But that which maketh an end of the question is, that Mistletoe hath been found to put forth under the Boughs, and not (onely) above the Boughs; so it cannot be any thing that falleth upon the Bough. Mistletoe groweth chiefly upon Crab-trees, Apples-trees, sometimes upon H. fies, and rarely upon Oaks; the Mistletoe whereof is counted very Medicinal. It is ever green, Winter and Summer, and beareth a white glistering Berry; and it is a Plant, utterly differing from the Plant, upon which it groweth. Two things therefore may be certainly set down: First, that Superfation must be by abundance of Sap, in the Bough that putteth it forth. Secondly, that that Sap must be such as the Tree doth excern, and cannot assimilate, for else it would go into a Bough; and besides, it seemeth to be more fat and unctuous, than the ordinary Sap of the Tree; both by the Berry which is clammy, and by that it continueth green Winter and Summer, which the Tree doth not.

557. This *Experiment of Mistletoe* may give light to other practices; therefore tryal would be made, by ripping of the Bough of a Crab-tree in the Bark, and watering of the Wound every day, with warm water dunded, to see if it would bring forth Mistletoe, or any such like thing. But it were yet more likely, to try it with some other watering or anointing, that were not so natural to the Tree as Water is; as Oyl, or Barm of Drink, &c. So they be such things as kill not the Bough.

558. It were good to try, what *Plants* would put forth, if they be forbidden to put forth their natural Boughs: Powl therefore a Tree, and cover it, some thickness with Clay on the top, and see what it will put forth. I suppose it will put forth Roots; for so will a Cions, being turned down into Clay. Therefore in this Experiment also, the Tree would be closed with somewhat that is not so natural to the Plant as Clay is; try it with Leather, or Cloth, or Painting, so it be not hurtful to the Tree. And it is certain, that a Brake hath been known to grow out of a Pollard.

559. A Man may count the Prickes of Trees to be a kinde of Excrecence, for they will never be Boughs, nor bear Leaves. The Plants that have Prickles, are Thorns, Black and White; Bryer, Rose, Lemmon-trees, Crab-trees, Goosberry, Berberry; these have it in the Bough. The Plants that have Prickles in the Leaf are, Holly, Juniper, Whin-bush, Thistle; Nettles also have a small venemous Prickle; so hath Borrage, but harmless. The cause must be, hasty putting forth, want of moisture, and the closeness of the Bark: For the haste of the Spirit to put forth, and the want of nourishment to put forth a Bough, and the closeness of the Bark, cause Prickles in Boughs; and therefore they are ever like a *Pyramis*, for that the moisture spendeth after a little putting forth. And for Prickles in Leaves, they come also of putting forth more Juyce into the Leaf, that can spread in the Leaf smooth; and therefore the Leaves otherwise are rough, as Burrage and Nettles are. As for the Leaves of Holly, they are smooth, but never plain, but as it were with folds for the same cause.

560. There be also *Plants*, that though they have no Prickles, yet they have a kinde of Downey or Velvet Rine upon their Leases; as *Rose-Campion*, *Stock-Gilliflowers*, *Colts-foot*; which Down or Nap cometh of a subtile Spirit, in a soft or fat substance. For it is certain, that both *Stock-Gilliflowers*, and *Rose-Campions*,

Campions, stamped, have been applied (with success) to the Wreists of those that have had *Tertian* or *Quartan Agues*; and the *Vapor* or *Colts-foot* have a sanative vertue towards the Lungs, and the Leaf also is healing in *Surgery*.

Another kinde of Excrecence is an Exudation of Plants, joyned with Putrefaction, as we see in Oak-Apples, which are found chiefly upon the Leaves of Oaks, and the like upon Willows: And Countrey people have a kinde of Prediction, that if the Oak-Apple, broken, be full of Worms, it is a sign of a pestilent year; which is a likely thing, because they grow of corruption.

There is also upon *Sweet*, or other *Bryer*, a fine Tuft, or Brush of Moss of divers colours; which if you cut, you shall ever finde full of little white Worms.

It is certain, that *Earth* taken out of the Foundations of *Vaults* and *Houses* and bottoms of *Wells*, and then put into *Pots*, will put forth sundry kinde of *Herbs*: But some time is required for the Germination; for if it be taken but from a Fathom deep, it will put forth the first year, if much deeper, not till after a year or two.

The nature of the *Plants* growing out of the *Earth* so taken up, doth follow the nature of the Mould it self, as if the Mould be soft and fine, it putteth forth soft *Herbs*; as *Grass*, *Plantane*, and the like: If the *Earth* be harder and courser, it putteth forth *Herbs* more rough, as *Thistles*, *Firs*, &c.

It is common Experience, that where *Alleys* are close gravelled, the *Earth* putteth forth the first year *Knot Grass*, and after *Spire Grass*. The cause is, for that the hard Gravel or Pebble at the first laying, will not suffer the *Grass* to come forth upright, but turneth it to finde his way where it can; but after that the *Earth* is somewhat loosened at the top, the ordinary *Grass* cometh up.

It is reported, that *Earth* being taken out of shady and watry Woods, some depth, and potted, will put forth *Herbs* of a fat and juicy substance; as *Penny-wort*, *Purslane*, *Housleek*, *Penny Royal*, &c.

The *Water* also doth send forth *Plants* that have no *Roots* fixed in the bottom; but they are less perfect *Plants* being almost but *Leaves*, and those small ones: Such is that we call *Duck-weed*, which hath a *Leaf* no bigger then a *Thyme Leaf*, but of a fresher *Green*, and putteth forth a little string into the *Water*, far from the bottom. As for the *Water-Lilly*, it hath a *Root* in the *Ground*; and so have a number of other *Herbs* that grow in *Ponds*.

It is reported by some of the *Ancients*, and some *Modern Testimony* likewise, that there be some *Plants*, that grow upon the top of the *Sea*; being supposed to grow of some concretion of *Slime* from the *Water*, where the *Sun* heateth hot, and where the *Sea* stirreth little. As for the *Alga Marina*, (*Sea-weed*) and *Eringium* (*Sea-Thistle*) both the *Roots*; but have *Sea-weed* under the *Water*, the *Sea Thistle* but upon the *Shore*.

The *Ancients* have noted, that there are some *Herbs* that grow out of *Snow*, laid up close together, and putrified; and that they are all bitter, and they name one especially, *Floesus*, which we call *Moth-Mollusc*. It is certain, that *Worms* are found in *Snow* commonly, like *Earth-worms*; and therefore it is not unlike, that it may likewise put forth *Plants*.

564.

565.

566.

567.

568.

569.

570.

The Ancients have affirmed, that there are some Herbs that grow out of Stone, which may be, for that it is certain, that Toads have been found in the middle of a Freestone. We see also, that Flints lying above ground gather Moss; and Wall-flowers, and some other Flowers grow upon Walls. But whether upon the main Brick or Stone, or whether out of the Lime, or Chinks, is not well observed. For Elders and Ashes have been seen to grow out of Steeples; but they manifestly grow out of Clefts, inasmuch as, when they grow big, they will disjoyn the Stone. And besides, it is doubtful, whether the Mortar it self putteth it forth, or whether some Seeds be not let fall by Birds. There be likewise Rock-Herbs, but I suppose those are, where there is some Mould or Earth. It hath likewise been found, that great Trees, growing upon Quarries, have put down their Root into the Stone.

571.

In some Mines in *Germany*, as is reported, there grow in the bottom Vegetables; and the Workfolks use to say, They have *Magical Vertue*, and will not suffer men together them.

572.

The Sea-lands seldom bear Plants. Whereof the cause is yielded by some of the Ancients, for that the Sun exhaleth the Moisture, before it can incorporate with the Earth, and yield a Nourishment for the Plant. And it is affirmed also, that Sand hath (always) his Root in Clay; and that there be no Veins of Sand, any great depth within the Earth.

573.

It is certain, that some Plants put forth for a time of their own store, without any Nourishment from Earth, Water, Stone, &c. Of which, *vide the Experiment 29.*

574.
Experiments
in Consort,
touching
Foreign Plants

IT is reported, That Earth that was brought out of the *Indies*, and other remote Countreys for Ballast for Ships, cast upon some Grounds in *Italy*, did put forth Foreign Herbs, to us in *Europe* not known; and, that which is more, that of their Roots, Barks, and Seeds, contused together, and mingled with other Earth, and well wated with warm Water, there came forth Herbs much like the other.

575.

Plants, brought out of hot Countreys, will endeavor to put forth at the same time, that they do usually do in their own climate; and therefore to preserve them, there is no more required than to keep them from the injury of putting back by Cold. It is reported also, that Grain out of the hotter Countreys translated into the Colder, will be more forward than the ordinary Grain of the cold Countrey. It is likely, that this will prove better in Grains, than in Trees; for that Grains are but Annual, and so the vertue of the Seed is not worn out, whereas in a Tree, it is embased by the Ground, to which it is removed.

576.

Many Plants, which grow in the hotter Countreys, being set in the colder, will nevertheless, even in those cold Countreys, being sown of Seeds late in the Spring come up and abide most part of the Summer; as we finde it in Orange, and Lemmon Seeds, &c. The Seeds whereof, sown in the end of *April*, will bring forth excellent Sallets, mingled with other Herbs. And I doubt not, but the Seeds of Clove-Trees, and Pepper-Seeds, &c. If they could come hither Green enough to be sown, would do the like.

There

Here be some *Flowers, Blossoms, Grains, and Fruits*, which come more early, and others which come more late in the year. The *Flowers* that come early with us, are, *Prime-Roses, Violets, Anemonies, Water-Daffodillies, Crocus Vernus*, and some early *Tulippa's*. And they are all cold Plants, which therefore (as it should seem) have a quicker Perception of the heat of the Sun increasing, than the hot Herbs have, as a cold hand will sooner finde a little warmth, than a hot. And those that come next after, are *Wall-Flowers, Cowslips, Hyacinths, Rosemary-flowers, &c.* And after them *Pinks, Roses, Flowerdeluces, &c.* And the latest are, *Gilly-flowers, Holly-Oaks, Larks-Foot, &c.* The earliest Blossoms are, the Blossoms of *Peaches, Almonds, Cornelians, Mezerions, &c.* And they are of such Trees, as have much moisture, either *Watery, or Oily*. And therefore *Crocus Vernus* also, being an Herb that hath an *Oily Juyce*, putteth forth early. For those also finde the Sun sooner than the dryer Trees. The *Grains* are, first *Rye and Wheat*, then *Oats and Barley*, then *Pease and Beans*; for though *Green Pease and Beans* be eaten sooner, yet the dry ones that are used for *Horse-meat*, are ripe last; and it seemeth, that the fatter Grain cometh first. The earliest *Fruits* are, *Strawberries, Cherries, Gooseberries, Corrans*; and after them early *Apples, early Pears, Apricots, Rasps*; and after them, *Damofins*, and most kinde of *Plumbs, Peaches, &c.* And the latest are, *Apples, Wardens, Grapes, Nuts, Quinces, Almonds, Sloes, Brier-berries, Heps, Medlars, Services, Cornelians, &c.*

It is to be noted, That (commonly) Trees that ripen latest, blossom soonest; as *Peaches, Cornelians, Sloes, Almonds, &c.* And it seemeth to be a work of providence that they blossom so soon, for otherwise they could not have the Sun long enough to ripen.

There be *Fruits* (but rarely) that come twice a year; as some *Pears, Strawberries, &c.* And it seemeth, they are such as abound with nourishment, whereby after one period, before the Sun waxeth too weak, they can endure another. The *Violet* also, amongst *Flowers*, cometh twice a year, especially the double *White*, and that also is a Plant full of moisture. *Roses* come twice; but it is not without cutting, as hath been formerly said.

In *Muscovia*, though the *Corn* come not up till late Spring, yet their Harvest is as early as ours. The cause is, for that the strength of the Ground is kept in with the *Snow*; and we see with us, that if it be a long *Winter*, it is commonly a more plentiful year: And after those kinde of *Winters* likewise, the *Flowers* and *Corn* which are earlier and later, do come commonly at once, and at the same time; which troubleth the *Husbandman* many times: For you shall have *Red-Roses* and *Damask-Roses* come together, and likewise the Harvest of *Wheat* and *Barley*. But this hapneth ever, for that the earlier stayeth the later, and not that the later cometh sooner.

There be divers *Fruit Trees*, in the hot *Countreys*, which have Blossoms, and young fruit, and ripe fruit, almost all the year; succeeding one another. And it is said, the *Orange* hath the like with us, for a great part of *Summer*, and so also hath the *Fig*. And no doubt, the *Natural Motion* of *Plants* is to have so: But that either they want *Juyce* to spend, or they meet with the cold of the *Winter*. And therefore this Circle of ripening cannot be, but in succulent *Plants*, and hot *Countreys*.

577.

in Consort,
touching the
Seasons in
which Plants
come forth.

578.

579.

580.

581.

Some

582.

Some Herbs are but *Annual*, and die *Root* and all once a year; as *Bor-
rage, Lettuce, Cucumbers, Musk-Melons, Basil, Tobacco, Mustard-seed*, and all kindes
of *Corn*; some continue many years, as *Hyssope, Germander, Lavender, Fennel,
&c.* The cause of the *Dying* is double; the first is, the tenderness and
weakness of the *Seed*, which maketh the period in a small time, as it is in
Borrage, Lettuce, Cucumbers, Corn, &c. And therefore none of these are hot.
The other cause is, for that some Herbs can worke endure cold, as *Basil,
Tobacco, Mustard-seed*; and these have (all) much heat.

583.

Experiments
in Consort,
touching the
Lasting of
Herbs and
Trees.

THe lasting of *Plants*, is most in those that are largest of *Bodies*, as *Oaks,
Elm, Chesnut, the Loar-tree, &c.* And this holdeth in *Trees*, but in *Herbs*
it is often contrary; for *Borrage, Coleworts, Pompions*, which are *Herbs*
of the largest size, are of small durance; whereas *Hyssope, Winter-Savory,
Germander, Thyme, Sage*, will last long. The cause is, for that *Trees* last ac-
cording to the strength, and quantity of their *Sap* and *Juyce*, being
well munited by their *Bark*, against the injuries of the *Air*: But *Herbs*
draw a weak *Juyce*, and have a soft *Stalk*; and therefore those a-
mongst them which last longest, are *Herbs* of strong smell, and with a
sticky stalk.

584.

Trees that bear *Mast* and *Nuts*, are commonly more lasting, than those
that bear *Fruits*, especially the moister *Fruits*; as *Oaks, Beeches, Chesnuts,
Walnuts, Almonds, Pine trees, &c.* last longer than *Apples, Pears, Plumbs,
&c.* The cause is, the fatness, and oyliness of the *Sap*; which ever wasteth
less, than the more *Watry*.

585.

Trees that bring forth their *Leaves* late in the year, and cast them like-
wise late, are more lasting than those that sprout their *Leaves* early, or shed
them betimes. The cause is, for that the late coming forth, sheweth a moi-
sture more fixed; and the other loose, and more easily resolved. And the
same cause is, that wilde *Trees* last longer than *Garden-trees*; and in the
same kinde, those whose *Fruit* is acide more than those whose *Fruit* is
sweet.

586.

Nothing procureth the lasting of *Trees, Bushes, and Herbs*, so much
as often cutting; for every cutting causeth a renovation of the *Juyce*
of the *Plant*; that it neither goeth so far, nor riseth so faintly, as when
the *Plant* is not cut: Infomuch, as *Annual Plants*, if you cut them sea-
sonably, and will spare the use of them, and suffer them to come up still
young, will last more years than one, as hath been partly touched; such
as is *Lettuce, Purslane, Cucumber, and the like*. And for great *Trees*,
we see almost all overgrown *Trees* in *Church-yards, or near ancient
Building, and the like*, are *Pollards* or *Dottards*, and not *Trees* at their
full height.

587.

Some *Experiment* would be made, how by *Art* to make *Plants* more
lasting than their ordinary period; as to make a *Stalk* of *Wheat, &c.* last a
whole year. You must ever presuppose, that you handle it so, as the *Winter*
killeth it not; for we speak onely of prolonging the *Natural Period*. I con-
ceive, that the *Rule* will hold, That whatsoever maketh the *Herb* come later,
than at his time will make it last longer time: It were good to try it in a *Stalk*
of *Wheat, &c.* set in the shade, and encompassed with a case of *Wood*, not
touching the *Straw*, to keep out open *Air*.

588.

As for the *Preservation* of *Fruits*, as well upon the *Tree* or *Stalk*, as
gathered, we shall handle it under the *Title* of *Conservation of Bodies*.

The

THE Particular Figures of *Plants* we leave to their descriptions, but some few things in general, we will observe. Trees and Herbs, in the growing forth of their Boughs and Branches, are not figured, and keep no order. The cause is, for that the Sap, being restrained in the Rinde and Bark, breaketh not forth at all, (as in the Bodies of Trees, and Stalks of Herbs,) till they begin to branch, and then, when they make an eruption, they break forth casually, where they finde best way in the Bark or Rinde. It is true, that some Trees are more scattered in their Boughs; as *Sallow trees, Warden-trees, Quince-trees, Medlar-trees, Lemmon trees, &c.* Some are more in the form of a *Pyramis*, and come almost to tod; as the *Pear-trees* (which the *Ci-ticks* will have to borrow his name of $\pi\tilde{\nu}\epsilon$ Fire) *Orange-trees, Fir-trees, Service-trees, Lime-trees, &c.* And some are more spread and broad, as *Beeches, Horn-beam, &c.* The rest are more indifferent. The cause of scattering the Boughs is, the hasty breaking forth of the Sap; and therefore those Trees rise not in a Body of any height, but Branch near the Ground. The cause of the *Pyramis* is, the keeping in of the Sap, long before it branch, and the spending of it, when it beginneth to branch, by equal degrees: The spreading is caused, by the carrying up of the Sap plentifully, without expence, and then putting it forth speedily, and at once.

There be divers Herbs, but no Trees, that may be said to have some kinde of order, in the putting forth of their Leaves: For they have Joynts, or Knuckles, as it were stops in their Germination; as have *Gilliflowers, Pinks, Fennel, Corn, Reeds, and Canes.* The cause whereof is, for that the Sap ascendeth unequally, and doth (as it were) tire and stop by the way. And it seemeth, they have some closeness and hardness in their Stalk, which hindereth the Sap from going up, until it hath gathered into a knot, and so is more urged to put forth. And therefore, they are most of them hollow, when the Stalk is dry; as *Fennel Stalks, Strubble, and Canes.*

Flowers have (all) exquisite *Figures*, and the Flower numbers are (chiefly) five and four; as in *Prime-Roses, Bryer-Roses, single Musk-Roses, single Pinks, and Gilliflowers, &c.* which have five Leaves; *Lillies, Flower-de-luces, Borage, Bugloss &c.* which have four Leaves. But some put forth Leaves not numbred, but they are ever small ones; as *Marigolds, Trifole, &c.* We see also, that the Sockets, and Supporters of Flowers, are Figured; as in the five Brethren of the *Rose, Sockets of Gilliflowers, &c.* Leaves also are all figured, some round, some long, none square, and many jagged on the sides; which Leaves of *Flowers* seldom are. For, I account, the jagging of *Pinks, and Gilliflowers,* to be like the inequality of *Oak-leaves, of Vine-leaves, or the like;* but they seldom or never have any small Purls.

OF *Plants* some few put forth their Blossoms before their Leaves; as *Almonds, Peaches, Cornelians, Black-Thorn, &c.* But most put forth some Leaves before their Blossoms; as *Apples, Pears, Plumbs, Cherry, White-Thorn, &c.* The cause is for that those that put forth their Blossoms first, have either an acute and sharp spirit; (and therefore commonly they all put forth early in the *Spring,* and ripen very late, as most of the particulars before mentioned) or else an oily Juyce, which is apter to put out Flowers than Leaves.

Of *Plants* some are Green all Winter, others cast their Leaves. There are Green all Winter, *Holly, Ivy, Box, Firr, Eugh, Cypress, Juniper, Bays, Rosemary, &c.* The cause of the holding Green, is the close and compact sub-

588

591.

Experiments
in Consort,
touching
Some principal
differences in
Plants.

592.

stance of their Leaves, and the Pedicles of them. And the cause of that again, is, either the tough and viscous Juice of the Plant, or the strength and heat thereof. Of the first sort, is *Holly*; which is of so viscous a Juice, as they make Birdlime of the Bark of it. The Stalk of *Ivy* is tough, and not fragile, as we see it in other small Twigs dry. *Fir* yieldeth Pitch. *Box* is a fast and heavy Wood, as we see it in Bowls. *Eugh* is a strong and rough Wood, as we see it in Bows. Of the second sort, is *Juniper*, which is a Wood odorate, and maketh a hot Fire. *Bays* is likewise a hot and aromatical Wood, and so is *Rosemary* for a Shrub. As for the Leaves, their density appeareth in that; either they are smooth and shining, as in *Bays*, *Holly*, *Ivy*, *Box* &c. or in that they are hard and foiry, as in the rest. And tryal would be made of Grafting of *Rosemary*, and *Bays*, and *Box*, upon a *Holly* Stock, because they are Plants that come all Winter. It were good to try it also with Grafts of other Trees, either Fruit trees, or Wild-trees, to see whether they will not yield their Fruit, or bear their Leaves later, and longer in the Winter; because the Sap of the *Holly* putteth forth most in the Winter. It may be also a Mezerion-tree grafted upon a *Holly*, will prove both an earlier, and a greater Tree.

593.

There be some Plants that bear no Flower, and yet bear Fruit; there be some that bear Flowers, and no Fruit; there be some that bear neither Flowers nor Fruit. Most of the great Timber-trees, (as Oaks, Beeches, &c.) bear no apparent Flowers; some few (likewise) of the Fruit-trees, as Mulberry, Walnuts, &c. And some Shrubs, (as Juniper, Holly, &c.) bear no Flowers. Divers Herbs also bear Seeds, (which is as the Fruit,) and yet bear no Flowers, as Purslane, &c. Those that bear Flowers, and no Fruit, are few, as the double Cherry, the Sallow, &c. But for the Cherry, it is doubtful, whether it be not by Art or Culture; for if it be by Art, then tryal would be made, whether Apples and other Fruits Blossoms may not be doubled. There are some few, that bear neither Fruit, nor Flower; as the Elm, the Poplars, Box, Braks, &c.

594.

There be some Plants that shoot still upwards, and can support themselves, as the greatest part of Trees and Plants: There be some other, that creep along the Ground, or wind about other Trees, or props, and cannot support themselves; as Vines, Ivy, Bryar, Briony, Wood-bines, Hops, Climatis, Camomil, &c. The cause is, (as hath been partly touched) for that all Plants, (naturally) move upwards; but if the Sap put up too fast, it maketh a slender Stalk, which will not support the weight; and therefore these latter sort are all swift and hasty comers.

595.

Experiments
in Consort,
touching all
Manner of
Composts and
Help of
Ground.

The first and most ordinary help is *Stercoration*. The *Sheeps-dung* is one of the best; and next, the *Dung of Kine*; and thirdly, that of *Horses*; which is held to be somewhat too hot, unless it be mingled; that of *Pigeons* for a Garden, as a small quantity of Ground, excelleth. The ordering of *Dung* is, if the Ground be Arable, to spread it immediately before the Ploughing and Sowing, and so to Plough it in: For if you spread it long before, the Sun will draw out much of the fatness of the *Dung*: If the Ground be Grazing Ground, to spread it somewhat late towards Winter, that the Sun may have the less power to dry it up. As for special *Composts* for *Gardens* (as a *Hot Bed*, &c.) we have handled them before.

596.

The second kinde of *Compost* is, the spreading of divers kindes of Earth; as *Marl*, *Chalk*, *Sea Sand*, *Earth upon Earth*, *Pond-Earth*, and the mixtures of them. *Marl* is thought to be the best, as having most fatness. And not heating

heating the Ground too much. The next is *Sea-sand*, which (no doubt) obtained a special vertue by the *Salt*; for *Salt* is the first rudiment of life. Chalk over-heateth the Ground a little; and therefore is best upon cold Clay Grounds, or moist Grounds: But I heard a great *Husband* lay, that it was a common error to think that Chalk helpeth Airable Grounds, but helpeth not Grazing Grounds, whereas (indeed) it helpeth Grasse as well as Corn: But that which breedeth the error is, because after the chalking of the Ground, they wear it out with many Crops, without rest; and then (indeed) afterwards it will bear little Grasse, because the Ground is tired out. It were good to try the laying of Chalk upon Airable Grounds, a little while before Ploughing, and to Plough it in, as they do the *Dung*; but then it must be Friable first, by Rain or Lying: As for *Earth* it compasseth it self; for I knew a great *Garden*, that had a *Field* (in a manner) poured upon it, and it did bear Fruit excellently the first year of the Planting; for the Surface of the *Earth* is ever the fruitfullest: And *Earth* so prepared hath a double Surface. But it is true, as I conceive, that such *Earth* as hath *Salt-Peter* bred in it, if you can procure it without too much charge, doth excel. The way to hasten the breeding of *Salt-Peter*, is to forbid the *Sun*, and the growth of Vegetables. And therefore, if you make a large Hovel, thatched, over some quantity of Ground; nay, if you do but planck the Ground over, it will breed *Salt-Peter*. As for *Pond-earth* or *River-earth*, it is a very good compost, especially, if the *Pond* have been long uncleaned, and so the *Water* be not too hungry; and I judge it will be yet better, if there be some mixture of Chalk.

The third help of Ground is, by some other Substances that have vertue to make Ground Fertile, though they be not merely *Earth*, wherein Ashes excel; insomuch as the *Countrys* about *Ama* and *Vesuvius* have a kinde of amends made them, for the mischief the eruptions (many times) do, by the exceeding fruitfulness of the soyl, caused by the Ashes scattered about. Soot also, though thin, spread in a *Field* or *Garden*, is tryed to be a very good compost. For *Salt* it is too costly; but it is tryed, that mingled with Seed-corn, and sown together, it doth good: And I am of opinion, that Chalk in *Powder*, mingled with Seed-corn, would do good; perhaps as much as Chalking the Ground all over. As for the steeping of the Seeds in several mixtures with *Water*, to give them vigor, or watering Grounds with *Compost-water*, we have spoken of them before.

The fourth help of Ground is, the suffering of Vegetables to die into the Ground, and so to fatten it; as the *Stubble* of *Corn*, especially *Pease*. *Brakes* cast upon the Ground in the beginning of *Winter*, will make it very fruitful. It were good (also) to try whether *Leaves* of *Trees* swept together, with some Chalk and *Dung* mixed, to give them more heart, would not make a good *Compost*: For there is nothing lost, so much as *Leaves* of *Trees*, and as they lie scattered, and without mixture, they rather make the Ground sour, than otherwise.

The fifth help of Ground is, Heat and Warmth. It hath been anciently practised to burn *Heath*, and *Ling* and *Sedge*, with the vantage of the *Wind*, upon the Ground. We see, that *Warmth* of *Walls* and *Incllosures*, mendeth Ground; we see also, that lying open to the *South*, mendeth Ground; we see again that the *Foldings* of *Sheep* help Ground as well by their warmth, as by their compost: And it may be doubted, whether the covering of the Ground with *Brakes*, in the beginning of the *Winter* (whereof we spake in the last *Experiment*) helpeth it not, by reason of the *Warmth*. Nay, some very good

597.

598.

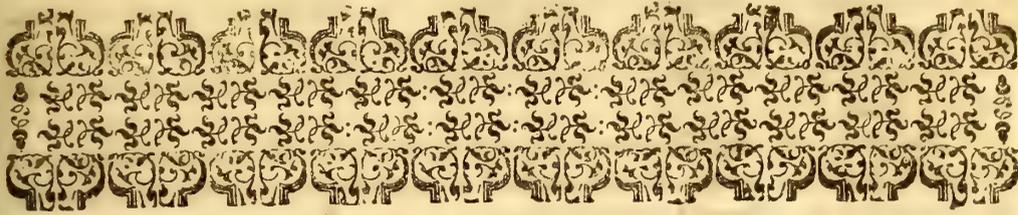

599.

Husbands do suspect, that the gathering up of Flints in Flinty Ground, and laying them on heaps (which is much used) is no good Husbandry for that they would keep the Ground warm.

600.

The sixth help of Ground is, by Watring and Irrigation, which is in two manners ; The one by Letting in, and shutting out Waters, at seasonable times; for Water, at some seasons, and with reasonable stay, doth good ; but at some other seasons, and with too long stay, doth hurt. And this serveth onely for Meadows, which are along some River. The other way is to bring Water from some hanging Grounds, where there are Springs into the lower Grounds, carrying it in some long Furrows ; and from those Furrows, drawing it traverse to spread the Water : And this maketh an excellent improvement, both for Corn and Grass. It is the richer, if those hanging Grounds, be fruitful, because it washeth off some of the fatness of the Earth ; but howsoever it profiteth much. Generally where there are great overflows in Fens, or the like, the drowning of them in the Winter, maketh the Summer following more fruitful : The cause may be for, that it keepeth the Ground warm, and nourisheth it. But the Fen-men hold, that the Sewers must be kept so, as the Water may not stay too long in the Spring, till the Weeds and Sedge be grown up ; for then the Ground will be like a Wood which keepeth out the Sun, and so continueth the wet ; whereby it will never graze (to purpose) that year. Thus much for Irrigation ; but for Avoidances, and Drainings of Water, where there is too much, and the helps of Ground in that kinde, we shall speak of them in another place.

NATURAL

NATURAL HISTORY.

Century VII.

The differences between *Animate* and *Inanimate Bodies*, we shall handle fully under the Title of *Life*, and *Living Spirits*, and *Powers*. We shall therefore make but a brief mention of them in this place. The main differences are two. All *Bodies* have *Spirits*, and *Pneumatical parts* within them; but the main differences between *Animate* and *Inanimate* are two. The first is, that the *Spirits* of things *animate*, are all confined with themselves, and are branched in *Veins*, and *secret Sanales*, as *Blood* is: And in *Living Creatures*, the *Spirits* have not only *Branches*, but certain *Sells* or *Seats*, where the principal *Spirits* do reside, and whereunto the rest do resort: But the *Spirits* in things *Inanimate* are shut in, and cut off by the *Tangible parts*; and are not pervious one to another, as *Air* is in *Snow*. The second main difference is, that the *Spirits* of *Animate Bodies* are all in some degree (more or less) kindled and inflamed, and have a fine commixture of *Flame*, and an *Aerial substance*: But *Inanimate Bodies* have their *Spirits* no whit inflamed or kindled. And this difference consisteth not in the *Heat* or *Coolness* of *Spirits*; for *Cloves* and other *Spices*, *Naptha* and *Petroleum*, have exceeding hot *Spirits* (hotter a great deal than *Oyl*, *Wax*, or *Tallow*, &c.) but not inflamed. And when any of those weak and temperate *Bodies* come to be inflamed, than they gather a much greater heat, than others have uninfamed, besides their light and motion, &c.

The differences which are secondary, and proceed from these two radical differences are, first, *Plants* are all figurate and determinate, which *Inanimate Bodies* are not; for look how far the *Spirit* is able to spread and continue it self, so far goeth the shape or figure, and then is determined. Secondly, *Plants* do nourish, *Inanimate Bodies* do not; they have an *Accretion*, but no *Alimentation*. Thirdly, *Plants* have a period of life, which *Inanimate Bodies* have not. Fourthly, they have a succession and propagation of their kinde, which is not in *Bodies inanimate*.

601.

Experiments
in Consort,
touching the
Affinities and
Differences,
between *Plants*
and *Inanimate*
Bodies.

602.

603. The differences between *Plants*, and *Metals*, or *Fossiles* besides those four beforementioned, (for *Metals* I hold inanimate) are these: First, *Metals* are more durable than *Plants*: Secondly, they are more solid and hard: Thirdly, they are wholly subterrany; whereas *Plants* are part above *Earth*, and part under *Earth*.

604. There be very few *Creatures* that participate of the Nature of *Plants*, and *Metals* both; *Coral* is one of the nearest of both kindes; another is *Virriol*, for that is aptest to sprout with moisture.

605. Another special Affinity is between *Plants* and *Mould*, or *Putrefaction*: For all *Putrefaction*, (if it dissolve not in *Arefaction*) will in the end issue into *Plants* or *Living Creatures* bred of *Putrefaction*. I account *Moss*, and *Mushromes*, and *Agarick*, and other of those kindes, to be but *Moulds* of the *Ground*, *Walls*, and *Trees*; and the like. As for *Flesh* and *Fish* and *Plants* themselves, and a number of other things, after a *Mouldiness*, or *Rottenness*, or *Corrupting*, they will fall to breed *Worms*. These *Putrefactions*, which have *Affinity* with *Plants*, have this difference from them; that they have no succession or propagation, though they nourish, and have a period of *Life*, and have likewise some *Figure*.

606. I left once, by chance, a *Citron* cut in a close room, for three Summermoneths, that I was absent; and at my return, there were grown forth out of the Pith cut, *Tufis* of *Hairs*, an inch long, with little black Heads as if they would have been some *Herb*.

607.

Experiments in Consort, touching the Affinities and Differences of *Plants*, and *Living Creatures*: And the *Confiner* and *Participles* of them.

THE Affinities and Differences between *Plants* and *Living Creatures*, are these that follow. They have both of them *Spirits* continued and branched, and also inflamed. But first in *Living Creatures* the *Spirits* have a *Cell* or *Seat*, which *Plants* have not, as was also formerly said. And secondly, the *Spirits* of *Living Creatures* hold more of *Flame*, than the *Spirits* of *Plants* do; and these two are the Radical differences. For the Secondary differences, they are as follow. First, *Plants* are all fixed to the *Earth*; whereas all *Living Creatures* are severed, and of themselves. Secondly, *Living Creatures* have *Local Motion*, *Plants* have not. Thirdly, *Living Creatures* nourish from their upper parts by the *Mouth* chiefly; *Plants* nourish from below, namely from the *Roots*. Fourthly, *Plants* have their *Seed* and *Seminal* parts uppermost, *Living Creatures* have them lowermost; and therefore it was said, not Elegantly alone, but Philosophically: *Homo est Planta inversa*. *Man* is like a *Plant* turned upwards; For the *Root* in *Plants*, is as the *Head* in *Living Creatures*. Fifthly, *Living Creatures* have a more exact *Figure* than *Plants*. Sixthly, *Living Creatures* have more diversity of *Organs* within their *Bodies* and (as it were) inward *Figures* than *Plants* have. Seventhly, *Living Creatures* have *Sense*, which *Plants* have not. Eighthly, *Living Creatures* have *Voluntary Motion*, which *Plants* have not.

608.

For the difference of *Sexes* in *Plants*, they are oftentimes by name distinguished; as *Male-Piony*, *Female Piony*; *Male Rosemary*, *Female-Rosemary*; *He-Holly*, *She-Holly*, &c. But *Generation* by *Copulation* (certainly) extendeth not to *Plants*. The nearest approach of it, is between the *He-Palm*, and the *She-Palm*, which (as they report) if they grow near, incline the one to the other; insomuch as, (that which is more strange) they doubt not to report, that to keep the *Trees* upright from bending, they tye *Ropes* or *Lines* from the one to the other, that the contact might be enjoyed by the contact of a middle *Body*. But this may be feigned, or at least amplified. Nevertheless, I

am apt enough to think, that this same *Binarium* of a stronger and a weaker, like unto *Masculine* and *Feminine*, doth hold in all Living Bodies. It is confounded sometimes; as in some Creatures of Putrefaction, wherein no marks of distinction appear; and it is doubled sometimes, as in Hermaphrodites: but generally there is a degree of strength in most Species.

The Participles or Confiners between Plants and Living Creatures, are such chiefly as are fixed, and have not Local Motion of remove; though they have a Motion in their parts, such as are Oysters, Cockles, and such like, There is a fabulous Narration, That in the *Northern Countreys* there should be an Herb that groweth in the likeness of a *Lamb*, and feedeth upon the Grass, in such sort, as it will bear the Grass round about. But, I suppose, that the Figure maketh the Fable; for so we see there be Bee-flowers, &c. And as for the Grass, it seemeth the Plant, having a great stalk and top, doth prey upon the Grass a good way about, by drawing the Juyce of the *Earth* from it.

609.

THe *Indian Fig* boweth his Roots down so low in one year, as of it self it taketh Root again; and so multiplieth from Root to Root, making of one Tree a kinde of Wood. The cause is, the plenty of the Sap, and the softness of the stalk, which maketh the Bough, being over-loaden, and not stiffly upheld, weigh down. It hath Leaves as broad as a little Target, but the Fruit no bigger than Beans. The cause is, for that the continual shade increaseth the Leaves, and abateth the Fruit; which nevertheless is of a pleasant taste. And that (no doubt) is caused, by the suppleness and gentleness of the Juyce of that Plant, being that which maketh the Boughs also so flexible.

610.
Experiments
Promiscuous
touching
Plants.

It is reported by one of the *Ancients*, that there is a certain *Indian Tree*, having few, but very great Leaves, three cubits long, and two broad; and that the Fruit being of good taste, groweth out of the Bark. It may be there be Plants that pour out the Sap so fast, as they have no leisure, either to divide into many Leaves, or to put forth Stalks to the Fruit. With us Trees generally have small Leaves in comparison: The *Fig* hath the greatest, and next it the *Vine*, *Mulberry*, and *Sycamore*, and the least are those of the *Willow*, *Birch*, and *Thorn*. But there be found Herbs with far greater Leaves than any Tree; as the *Bur*, *Gourd*, *Cucumber*, and *Colewort*. The cause is, (like to that of the *Indian Fig*) the hasty and plentiful putting forth of the Sap.

611.

There be three things in use for sweetness, *Sugar*, *Honey*, *Manna*. For *Sugar*, to the *Ancients* it was scarce known, and little used. It is found in Canes; *Quere*. whether to the first *Knuckle*, or further up? and whether the very Bark of the Cane it self do yield *Sugar*, or no? For *Honey*, the *Bee* maketh it, or gathereth it; but I have heard from one, that was industrious in Husbandry, that the labor of the *Bee* is about the *Wax*, and that he hath known in the beginning of *May*, *Honey-Combs* empty of *Honey*, and within a fortnight, when the sweet Dews fall, filled like a *Cellar*. It is reported by some of the *Ancients*, that there is a Tree called *Occhus*, in the Valleys of *Eyr-cania*, that distilleth *Honey* in the Mornings. It is not unlike, that the Sap and Tears of some Trees may be sweet. It may be also, that some sweet Juyces, fit for many uses, may be concocted out of Fruits, to the thickness of *Honey*, or perhaps of *Sugar*; the likeliest are *Rafins* of the *Sun*, *Figs*, and *Corrans*: The Means may be enquired.

612.

The *Ancients* report of a Tree, by the *Persian Sea*, upon the *Shore-sands*, which

613.

which is nourished with the Salt-water; and when the Tide ebbeth, you shall see the Roots, as it were, bare without Bark (being, as it seemeth, corroded by the Salt) and grasping the Sands like a Crab, which nevertheless beareth a Fruit. It were good to try some hard Trees, as a Service-Tree or Fir-Tree, by setting them within the Sands.

614. There be of Plants which they use for Garments, these that follow, *Hemp, Flax, Cotton, Nettles*, (whereof they make *Nettle Cloth*) *Sericum*, which is a growing Silk; they make also *Cables* of the Bark of *Lime-Trees*. It is the *Stalk* that maketh the *Filaceous* matter commonly, and sometimes the *Down* that groweth above.

615. They have in some Countreys, a Plant of a *Rosie-colour*, which shurteth in the Night, openeth in the Morning, and openeth wide at Noon; which the Inhabitants of those Countreys say, is a Plant that sleepeth. There be Sleepers enough then; for almost all Flowers do the like.

616. Some Plants there are, but rare, that have a *Mossie* or *Downy* Root, and likewise that have a number of *Threds* like *Beards*, as *Mandrakes*; whereof *Witches* and *Impostors* make an ugly Image, giving it the form of a face at the top of the Root, and leave those strings to make a broad Beard down to the foot. Also there is a kinde of *Nard* in *Creet* (being a kinde of *Phu*) that hath a Root hairy, like a *Rough-footed Doves* foot. So as you may see, there are of *Roots, Bulbous Roots, Fibrous Roots, and Hirsute Roots*. And, I take it, in the *Bulbous*, the Sap hastneth most to the Air and Sun: In the *Fibrous*, the Sap delighteth more in the Earth, and therefore putteth downward; and the *Hirsute* is a middle between both, that besides the putting forth upwards and downwards, putteth forth in round.

617. There are some *Tears of Trees*, which are kembed from the *Beards of Goats*; for when the *Goats* bite and crop them, especially in the Mornings, the Dew being on, the Tear cometh forth, and hangeth upon their Beards: Of this sort is some kinde of *Ladanum*.

618. The irrigation of the *Plane-tree* by *Wine*, is reported by the *Ancients*, to make it fruitful. It would be tryed likewise with *Roots*; for upon *Seeds* it worketh no great effect.

619. The way to carry *Foreign Roots*, a long way, is to vessel them close in *Earthen vessels*; but if the *Vessels* be not very great, you must make some holes in the bottom, to give some refreshment to the *Roots*; which otherwise (as it seemeth) will decay, and suffocate.

620. The ancient *Cinnamon*, was, of all other Plants, while it grew, the driest; and those things which are known to comfort other Plants, did make that more steril; for in showers it prospered worst: It grew also amongst *Bushes* of other kindes, where commonly Plants do not thrive, neither did it love the Sun. There might be one cause of all those effects, namely, the sparing nourishment, which that Plant required. *Quare*, how far *Cassia*, which is now the substitute of *Cinnamon*, doth participate of these things.

621. It is reported by one of the *Ancients*, that *Cassia*, when it is gathered, is put into the *Skins* of *Beasts* newly fleyed; and that the *Skins* corrupting, and breeding *Worms*, the *Worms* do devour the *Pith* and *Marrow* of it, and so make it hollow, but meddle not with the *Bark*, because to them it is bitter.

622. There were in ancient time, *Vines* of far greater Bodies, then we know any; for there have been *Cups* made of them, and an *Image* of *Jupiter*. But it is like they were wilde *Vines*; for the *Vines* that they use for *Wine*, are so often

often cut; and so much digged and dressed, that their Sap spendeth into the Grapes, and so the Stalk cannot increase much in bulk. The Wood of Vines is very durable, without rotting. And that which is strange, though no Tree hath the Twigs, while they are green, so brittle, yet the Wood dried is extreme tough, and was used by the Captains of Armies amongst the *Romans* for their Cudgels.

It is reported, That in some places, Vines are suffered to grow like Herbs spreading upon the Ground, and that the Grapes of those Vines are very great. It were good to make tryal, whether Plants that use to be born up by props, will put forth greater Leaves, and greater Fruits if they be laid along the Ground; as *Hops, Ivy, Woodbine, &c.*

Quinces or Apples &c. if you will keep them long, drown them in *Honey*; but because *Honey* (perhaps) will give them a taste over-lushious, it were good to make tryal in Powder of Sugar, or in Syrrup of Wine onely boiled to height. Both these would likewise be tried in *Orenges, Lemmons, and Pomegranates*; for the Powder of Sugar, and Syrrup of Wine, will serve for times more than once.

The *Conservation of Fruit* would be also tried in Vessels, filled with fine Sand, or with Powder of Chalk, or in Meal and Flower, or in Dust of Oak-wood, or in Mill.

Such Fruits as you appoint for long keeping, you must gather before they be full ripe, and in a fair and dry day, towards Noon; and when the Wind bloweth not South, and when the Moon is under the Earth, and in decrease.

Take Grapes, and hang them in an empty Vessel, well stopped; and set the Vessel not in a Cellar, but in some dry place, and it is said, they will last long. But it is reported by some, they will keep better in a Vessel half full of Wine, so that the Grapes touch not the Wine.

It is reported, that the preserving of the Stalk, helpeth to preserve the Grape; especially, if the Stalk be put into the Pith of Elder, the Elder not touching the Fruit.

It is reported by some of the *Ancients*, that Fruit put into Bottles, and the Bottles let down into Wells under water, will keep long.

Of Herbs and Plants, some are good to eat Raw; as *Lettuce, Endive, Purslane, Tarragon, Cresses, Cucumbers, Musk-Melons, Radish, &c.* Others onely after they are boiled, or have passed the Fire; as *Parsley, Clary, Sage, Parsnips, Turnips, Asparagus, Artichoaks*, (though they also being young are eaten raw.) But a number of Herbs are not esculent at all; as *Wormwood, Grass Green-Corn, Centory, Hyssope, Lavender, Balm, &c.* The causes are, for that the Herbs that are not esculent, do want the two tastes, in which nourishment resteth; which are fat and sweet, and have (contrariwise) bitter and over-strong tastes, or a juyce so crude, as cannot be ripened to the degree of Nourishment, Herbs, and Plants, that are Esculent raw, have fatness, or sweetness (as all Esculent Fruits) such are *Onions, Lettuce, &c.* But then it must be such a fatness (for as for sweet things, they are in effect always esculent) as is not over-gross, as loading of the Stomack; for *Parsnips and Leeks* have fatness; but it is too gross and heavy without boiling. It must be also in a substance somewhat tender; for we see *Wheat, Barley, Artichoaks*, are no good Nourishment, till they have passed the Fire; but the Fire doth ripen, and maketh them soft and tender, and so they become esculent. As for *Raddish, and Tarragon*, and the like, they are for *Condi-ments*, and not for Nourishment; and even some of those Herbs, which are

not

623.

624.

625.

626.

627.

628.

629.

630.

not esculent, are notwithstanding poculent ; as *Hops, Broom, &c.* *Quare*, what Herbs are good for Drink, besides the two-aforenamed ; for that it may (perhaps) ease the charge of Brewing, if they make Beer to require less Malt, or make it last longer.

631. Parts fit for the nourishment of *Man in Plants*, are *Seeds, Roots, and Fruits*; but chiefly *Seeds and Roots*. For *Leaves*, they give no nourishment at all, or very little; no more do *Flowers, or Blossoms, or Stalks*. The reason is, for that *Roots, and Seeds, and Fruit*, (in as much as all *Plants* consist of an Oily, and Watry substance commixed) have more of the Oily substance, and *Leaves, Flowers, &c.* of the Watry. And secondly, they are more concocted, for the *Root*, which continueth ever in the *Earth*, is still concocted by the *Earth*; and *Fruits and Grains* (we see) are half a year, or more in concocting; whereas *Leaves* are out, and perfect in a Moneth.

632. *Plants* (for the most part) are more strong, both in taste and smell in the *Seed*, than in the *Leaf and Root*. The cause is, for that in *Plants* that are not of a fierce and eager spirit, the vertue is increased by Concoction and Maturation, which is ever most in the *Seed*; but in *Plants* that are of a fierce and eager spirit, they are stronger whilest the spirit is inclosed in the *Root*; and the spirits do but weaken and dissipate, when they come to the *Air and Sun*; as we see in *Onions, Garlick, Dragon, &c.* Nay, there be *Plants* that have their *Roots* very hot and aromatical, and their *Seeds* rather insipide as *Ginger*. The cause is (as was touched before) for that the heat of those *Plants* is very dissipable; which under the *Earth* is contained and held in, but when it cometh to the *Air*, it exhalet.

633. The *Juyces of Fruits*, are either *Watry or Oily*. I reckon amongst the *Watry*, all the *Fruits*, out of which, *Drink* is expressed; as the *Grape, the Apple, the Pear, the Cherry, the Pomegranate, &c.* And there are some others, which though they be not in use for *Drink*, yet they appear to be of the same nature; as *Plums, Services, Mulberries, Rapps, Oreuges, Lemmons, &c.* And for those *Juyces* that are so fleshy, as they cannot make *Drink* by Expression, yet (perhaps) they may make *Drink* by mixture of *Water*.

Poculaque admistis imitantur vitea Sorbis.

And it may be *Heps and Brier-Berries* would do the like. Those that have *Oily Juyces*, are *Olives, Almonds, Nuts* of all sorts, *Pine-Apples, &c.* and their *Juyces* are all inflamable. And you must observe also, that some of the *Watry Juyces*, after they have gathered spirit, will burn and enflame, as *Wine*. There is a third kinde of *Fruit* that is sweet, without either sharpness or oilyness; such as is the *Fig* and the *Date*.

634. It hath been noted, that most *Trees*, and especially those that bear *Mast*, are fruitful but once in two years. The cause, no doubt, is the expence of *Sap*; for many *Orchard Trees* well cultured, will bear divers years together.

635. There is no *Tree*, which besides the *Natural Fruit*, doth bear so many *Bastard Fruits* as the *Oak* doth; for besides the *Acorn*, it beareth *Galls, Oak-Apples*, and certain *Oak-Nuts*, which are inflamable; and certain *Oak-Berries* sticking close to the *Body of the Tree* without *Stalk*. It beareth also *Mistletoe*, though rarely. The cause of all these may be, the closeness, and solidness of the *Wood*, and *Pithe of the Oak*; which maketh several *Juyces* finde several *Eruptions*. And therefore, if you will devise to make any *Super-Plants*, you must ever give the *Sap* plentiful rising, and hard issue.

There

There are two Excrefcences which grow upon Trees; both of them in the nature of *Mushromes*; the one the *Romans* called *Boletus*, which groweth upon the Roots of Oaks, and was one of the dainties of their Table: The other is *Medicinal*, that is called *Agarick* (whereof we have spoken before) which groweth upon the tops of Oaks; though it be affirmed by some, that it groweth also at the Roots. I do conceive, that many Excrefcences of Trees grow chiefly, where the Tree is dead or faded; for that the Natural Sap of the Tree, corrupteth into some Prenatural substance.

636.

The greater part of Trees bear most, and best on the lower Boughs; as *Oaks*, *Figs*, *Walnuts*, *Pears*, &c. But some bear best on the top Boughs, as *Crabs*, &c. Those that bear best below, are such, as shade doth more good to than hurt: For generally all Fruits bear best lowest, because the Sap itreth, not having but a short way. And therefore in Fruits spred upon Walls, the lowest are the greatest, as was formely said: So it is, the shade that hindreth the lower Boughs, except it be in such Trees as delight in shade, or at least bear it well. And therefore they are either strong Trees, as the Oak, or else they have large Leaves, as the Walnut and Fig, or else they grow in *Pyramis* as the Pear. But if they require very much Sun, they bear best on the top; as it is *Ctabs*, *Apples*, *Plumbs*, &c.

637.

There be Trees that bear best when they begin to be old; as *Almonds*, *Pears*, *Vines*, and all Trees that give Mast. The cause is, for that all Trees that bear Mast have an oily Fruit; and young Trees have a more watry Juyce, and lets concocted; and of the same kinde also is the Almond. The Pear likewise though it be not oily, yet it requireth much Sap, and well concocted; for we see it is a heavy Fruit and solid, much more than *Apples*, *Plumbs*, &c. As for the Vine, it is noted that it beareth more Grapes when it is young; but Grapes that make better Wine when it is old, for that the Juyce is the better concocted: And we see, that Wine is inflamable, so as it hath a kinde of oiliness. But the most part of Trees, amongst which are *Apples*, *Plumbs*, &c. bear best when they are young.

638.

There be Plants that have a Milk in them when they are cut; as *Figs*, *Old Lettuce*, *Sow-thistles*, *Spurge*, &c. The cause may be an Inception of Putrefaction: For those Milks have all an Acrimony, though one would think they should be Lenitive. For if you write upon Paper with the Milk of the Fig, the Letters will not be seen, until you hold the Paper before the fire, and then they wax brown; which sheweth, that it is a sharp or fretting Juyce. Lettuce is thought poysonous, when it is so old as to have Milk: Spurge is a kinde of poyson in it self; and as for Sow-thistles, though *Coneys* eat them, yet Sheep and Cattel will not touch them; and besides, the Milk of them, rubbed upon Warts, in short time weareth them away: Which sheweth the Milk of them to be Corrowfive. We see also, that Wheat and other Corn sown, if you take them forth of the Ground, before they sprout, are full of Milk; and the beginning of Germination is ever a kinde of Putrefaction of the Seed. *Euphorbium* also hath a Milk, though not very white, which is of a great Acrimony. And *Saladine* hath a yellow Milk, which hath likewise much Acrimony, for it cleanseth the Eyes; it is good also for *Cataracts*.

639.

Mushromes are reported to grow, as well upon the Bodies of Trees as upon their Roots, or upon the Earth, and especially upon the Oak. The cause is, for that strong Trees are towards such Excrefcences in the nature of Earth, and therefore put forth *Moss*, *Mushromes*, and the like.

640.

641. There is hardly found a *Plant* that yieldeth a red Juyce in the Blade or Ear, except it be the Tree that beareth *Sanguis Draconis*; which gr. weth chiefly in the Island *Soquotra*: the Herb *Aramanthus* (indeed) is red all over; and *Brasil* is red in the Wood; and so is *Red Sanders*. The Tree of *Sanguis Draconis* groweth in the form of a Sugar-Loaf; it is like the Sap of that *Plant* concocteth in the Body of the Tree. For we see, that *Grapes* and *Pomegranates* are red in the Juyce, but are Green in the Tear. And this maketh the Tree of *Sanguis Draconis* lesser towards the top, because the Juyce hastneth not up; and besides, it is very *Astringent*, and therefore of slow motion.
642. It is reported, that *Sweet Moss*, besides that upon the *Apple-trees*, groweth likewise (sometimes) upon *Poplars*, and yet (generally) the *Poplar* is a smooth Tree of Bark, and hath little Moss. The Moss of the *Larix-tree* burneth also sweet, and sparkleth in the burning. *Quere*, of the Mosses of *Odorate Trees*; as *Cedar*, *Cypress*, *Lignum*, *Aloes* &c.
643. The *Death*, that is most without pain, hath been noted to be upon the taking of the *Potion of Hemlock*; which in *Humanity* was the form of execution of capital offenders in *Athens*. The *Poyson* of the *Aspe*, that *Cleopatra* used, hath some affinity with it. The cause is, for that the torments of *Death* are chiefly raised by the strife of the *Spirits*; and these *Vapors* quench the *Spirits* by degrees; like to the death of an extream old Man. I conceive it is less painful then *Opium*, because *Opium* hath parts of heat mixed.
644. There be *Fruits* that are sweet before they ripen, as *Mirabolanes*; so *Fennel-seeds* are sweet before they ripen, and after grow spicy; and some never ripen to be sweet; as *Tamarinds*, *Barberries*, *Crabs*, *Sloes*, &c. The cause is, for that the former kinde have much and subtile heat, which causeth early sweetness; the latter have a cold and acide Juyce, which no heat of the Sun can sweeten. But as for the *Mirabolane*, it hath parts of contrary natures, for it is sweet and astringent.
645. There be few Herbs that have a *Salt taste*; and contrariwise, all *Blood of Living Creatures* hath a saltness; the cause may be, for that *Salt*, though it be the Rudiment of *Life*, yet in *Plants* the original taste remaineth not; for you shall have them bitter, sowre, sweet, biting, but seldom salt: But in *Living Creatures*, all those high tastes may happen to be (sometimes) in the humors, but are seldom in the flesh, or substance; because it is of a more oily Nature, which is not very susceptible of those tastes; and the saltness itself of *Blood*, is but a light and secret saltness: And even among *Plants*, some do participate of saltness, as *Alga Marina*, *Samphire*, *Scurvy Grass*, &c. And they report there is in some of the *Indian Seas*, a *Swimming Plant*, which they call *Salgazu*, spreading over the Sea, in sort, as one would think it were a *Meadow*. It is certain, that out of the *Ashes* of all *Plants*, they extract a *Salt* which they use in *Medicines*.
646. It is reported by one of the *Ancients*, that there is an Herb, growing in the *Water*, called *Lincostis*, which is full of *Prickles*: This Herb putteth forth another small Herb out of the Leaf, which is imputed to some moisture, that is gathered between the *Prickles*, which putrified by the Sun, germinateth. But I remember also, I have seen, for a great rarity, one *Rose* grow out of another, like *Honey Suckles*, that they call *Top and Top-gallants*.
647. *Barley* (as appeareth in the *Malting*) being steeped in *Water* three days, and afterwards the *Water* drained from it, and the *Barley* turned upon a dry Floor, will sprout half an inch long, at least: And if it be let alone, and not

not turned, much more, until the heart be out. Wheat will do the same; try it also with Pease and Beans. This Experiment is not like that of the Orpin and *Semper-vive*; for there it is of the old store, for no Water is added, but here it is nourished from the Water. The Experiment would be further driven; for it appeareth already, by that which hath been said, that Earth is not necessary to the first sprouting of Plants, and we see, that Rose-Buds set in Water, will blow: Therefore try whether the Sprouts of such Grains may not be raised to a further degree, as to an Herb or Flower, with Water onely, or some small commixture of Earth: For if they will, it should seem by the Experiments before, both of the Malt, and of the Roses, that they will come far faster on in Water then in Earth; for the nourishment is easilier drawn out of Water then out of Earth. It may give some light also, that Drink infused with Flesh, as that with the Capon, &c. will nourish faster and easilier, then Meat and Drink together. Try the same Experiment with Roots, as well as with Grains. As for example, take a Turnip and steep it a while, and then dry it, and see whether it will sprout.

Malt in the Drenching will swell, and that in such a manner, as after the putting forth in sprouts, and the drying upon the Kiln, there will be gained, at least, a Bushel in eight, and yet the sprouts are rubbed off, and there will be a Bushel of Dust besides the Malt; which I suppose to be, not onely by the loose and open laying of the Parts, but by some addition of substance drawn from the Water, in which it was steeped.

Malt gathereth a sweetness to the taste, which appeareth yet more in the Wort. The Dulcoration of things is worthy to be tryed to the full; for that Dulcoration importeth a degree to nourishment. And the making of things inalimental to become alimental, may be an Experiment of great profit for making new victual.

Most Seeds in the growing, leave their Husk or Rind about the Root; but the Onion will carry it up, that it will be like a cap upon the top of the young Onion. The cause may be, for that the Skin or Husk is not easie to break; as we see by the pilling of Onions, what a holding substance the Skin is.

Plants that have curled Leaves, do all abound with moisture, which cometh so fast on, as they cannot spread themselves plain, but must needs gather together. The weakest kinde of curling is roughness, as in Clary and Bur. The second is, curling on the sides; as in Lettuce and young Cabbage. And the third is, folding into an Head, as in Cabbage full grown; and Cabbage Lettuce.

It is reported, that Firr and Pine, especially if they be old and putrefied, though they shine not as some rotten Woods do, yet in the sudden breaking they will sparkle like hard Sugar.

The Roots of Trees do (some of them) put downwards deep into the Ground; as the *Oak*, *Pine*, *Firr*, &c. Some spread more towards the Surface of the Earth; as the *Ash*, *Cypress-tree*, *Olive*, &c. The cause of this latter may be, for that such Trees as love the Sun, do not willingly descend far into the Earth; and therefore they are (commonly) Trees that shoot up much; for in their Body their desire of approach to the Sun maketh them spread the less. And the same reason, under Ground, to avoid recess from the Sun, maketh them spread the more. And we see it cometh to pass in some Trees which have been planted to deep in the Ground, that for love of approach to the Sun, they forsake their first Root, and put out another more towards the top of the Earth. And we see also, that

648.

649.

650.

651.

652.

653.

the Olive is full of Oily Juyce, and Ash maketh the best Fire, and Cypress is an hot Tree. As for the Oak, which is of the former sort, it loveth the Earth, and therefore groweth slowly. And for the Pine, and Firr likewise, they have so much heat in themselves, as they need lets the heat of the Sun. There be Herbs also, that have the same difference; as the Herb they call *Morsus Diaboli*, which putteth the Root down so low, as you cannot pull it up without breaking; which gave occasion to the name and fable, for that it was said it was so wholesome a Root, *That the Devil when it was gathered, bit it for envy.* And some of the *Ancients* do report, that there was a goodly Firr (which they desired to remove whole) that had a Root under ground eight cubits deep, and so the Root came up broken.

654. It hath been observed, that a Branch of a Tree being unbarked some space at the bottom, and so set into the Ground, hath grown even of such Trees, as if the Branch were set with the Bark on, they would not grow; yet contrariwise we see, that a Tree pared round in the Body above Ground will die. The cause may be, for that the unbarkt part draweth the nourishment best, but the Bark continueth it onely.

655. *Grapes* will continue fresh and moist all Winter long, if you hang them cluster by cluster in the Roof of a warm Room, especially, if when you gather the cluster, you take off with the cluster some of the stock.

656. The Reed or Cane is a watry Plant, and groweth not but in the Water. It hath these properties, That it is hollow, that it is knuckled, both Stalk and Root, that being dry it is more hard and fragile then other Wood, that it putteth forth no Boughs, though many Stalks out of one Root. It differeth much in greatnes, the smallest being fit for thatching of Houses, and stopping the chinks of Ships better then Glew or Pitch. The second bigness is uted for Angle-rods and Staves, and in *China* for beating of offenders upon the Thighs. The differing kindes of them are, the common Reed, the *Cassia Fistula*, and the *Sugar-Reed*. Of all Plants it boweth the easiest, and riseth again. It seemeth, that amongst Plants which are nourished with mixture of Earth and Water, it draweth most nourishment from Water; which maketh it the smoothest of all others in Bark, and the hollowest in Body.

657. The Sap of *Trees*, when they are let Blood, is of differing Natures. Some more watry and clear, as that of Vines, of Beeches, of Pears; some thick, as Apples; some Gummy, as Cherries; some frothy, as Elms; some milky, as Figs. In Mulberries, the Sap seemeth to be (almost) towards the Bark onely; for if you cut the *Tree* a little into the Bark with a Stone, it will come forth, if you pierce it deeper with a tool, it will be dry. The *Trees* which have the moistest Juyces in their Fruit, have commonly the moistest Sap in their Body; for the Vines and Pears are very moist, Apples somewhat more spongy; the Milk of the Fig hath the quality of the Rennet, to gather Cheese, and so have certain four Herbs wherewith they make Cheese in Lent.

658. The *Timber* and *Wood* are in some *Trees* more clean, in some more knotty, and it is a good tryal, to try it by speaking at one end, and laying the Ear at the other: For if it be knotty, the voice will not pass well. Some have the Veins more varied and Chamloted; as *Oak*, whereof *Wainscot* is made; *Maple*, whereof *Trenchers* are made: Some more smooth, as *Firr* and *Walnut*; some do more easily breed Worms and Spiders; some more hardly, as it is said of *Irish Trees*. Besides, there be a number of differences

differences that concern their use : As Oak, Cedar, and Chestnut, are the best builders. Some are best for Plough-timber, as Ash; some for Peers, that are sometimes wet and sometimes dry, as Elm; some for Planchers, as Deal; some for Tables, Cupboards and Desks, as Walnuts; some for Ship-timber, as Oaks that grow in moist Grounds, for that maketh the Timber tough, and not apt to rift with Ordnance, wherein English and Irish Timber are thought to excel) some for Masts of Ships, as Firr and Pine, because of their length, straightness, and lightness; some for Pale, as Oak; some for Fuel, as Ash: And so of the rest.

The coming of Trees and Plants in certain Regions, and not in others, is sometimes casual; for many have been translated, and have prospered well; as *Damask Roses*, that have not been known in *England* above an hundred years, and now are so common. But the liking of Plants in certain Soyls more then in others, is meerly Natural; as the Firr and Pine love the Mountains; the Poplar, Willow, Sallow, and Alder, love Rivers and moist places; the Ash loveth Coppices, but is best in Standards alone; Juniper loveth Chalk, and so do most Fruit-trees; Sampire groweth but upon Rocks; Reeds and Osiers grow where they are washed with Winter; the Vine loveth sides of Hills turning upon the South-East Sun, &c.

659.

The putting forth of certain Herbs, discovereth of what nature the Ground where they put forth is; as wilde Thyme sheweth good Feeding Ground for Cattel; Bettony and Strawberries shew Grounds fit for Wood; Camomile sheweth mellow Grounds fit for Wheat; Mustard-seed growing after the Plough, sheweth a good strong Ground also for Wheat; Burnet sheweth good Meadow, and the like.

660.

There are found in divers Countreys, some other Plants that grow out of Trees and Plants, besides Mistletoe: As in *Syria* there is an Herb called *Cassius*, that groweth out of tall Trees, and windeth it self about the same Tree where it groweth, and sometimes about Thorns. There is a kinde of Polypode that groweth out of Trees, though it windeth not. So likewise an Herb called *Faunos* upon the Wilde Olive, and an Herb called *Hippophastron* upon the Fullers Thorn, which, they say, is good for the Falling-sickness.

661.

It hath been observed by some of the *Ancients*, that howsoever cold and Easterly winds are thought to be great enemies to Fruit, yet nevertheless South-winds are also found to do hurt, especially in the Blossoming time, and the more, if showers follow. It seemeth they call forth the moisture too fast. The West winds are the best. It hath been observed also, that green and open Winters do hurt Trees, insomuch, as if two or three such Winters come together, Almond-Trees, and some other Trees will die. The cause is the same with the former, because the Lust of the Earth overspendeth it self; howsoever some other of the *Ancients* have commended warm Winters.

662.

Snows lying long cause a fruitful year. For first, they keep in the strength of the Earth: Secondly, they water the Earth better then Rain; for in Snow the Earth doth (as it were) suck the Water as out of the Teat: Thirdly, the moisture of Snow is the finest moisture, for it is the Froth of the Cloudy Waters.

663.

Showrs, if they come a little before the ripening of Fruits, do good to all succulent and moist Fruits, as *Vines*, *Olives*, *Pomegranates*; yet it is rather for plenty then for goodness, for the best Wines are in the dryest Vintages.

664.

Small showers are likewise good for Corn, so as parching heats come not upon them. Generally, Night-showers are better then Day showers; for that the Sun followeth not to fall upon them: And we see, even in watering by the Hand, it is best in Summer time to water in the Evening.

665. The differences of *Earths*, and the tryals of them, are worthy to be diligently enquired. The Earth that with showers doth easily soften, is commended; and yet some Earth of that kinde will be very dry and hard before the showers. The Earth that casteth up from the Plough a great clod, is not so good as that which casteth up a smaller clod. The Earth that putterh forth Moss easily, and may be called *Mouldy*, is not good. The Earth that smelleth well upon the Digging, or Ploughing, is commended; as containing the Juycce of Vegetables almost already prepared. It is thought by some, that the ends of low Rain-bows fall more upon one kinde of Earth then upon another: As it may well be, for that Earth is most rosicide; and therefore it is commended for a sign of a good Earth. The poorness of the Herbs (it is plain) sheweth the poorness of the Earth, and especially, if they be in colour more dark: But if the Herbs shew withered or blasted at the top, it sheweth the Earth to be very cold; and so doth the Mossiness of Trees. The Earth whereof the Grass is soon parched with the Sun and roasted, is commonly forced Earth, and barren in his own nature. The tender, cheffom, and mellow Earth is the best; being meer Mould, between the two extreame of Clay and Sand, especially, if it be not Loamy and Binding. The Earth that after Rain will scarce be Ploughed, is commonly fruitful; for it is cleaving, and full of Juycce.

666. It is strange, which is observed by some of the *Anciens*, that Dust helpeth the fruitfulness of Trees, and of Vines by name; insomuch, as they cast Dust upon them of purpose. It should seem that that powdring, when a shower cometh, maketh a kinde of soyling to the Tree, being Earth and Water finely laid on. And they note, that Countreys where the Fields and Ways are dusty, bear the best Vines.

667. It is commended by the *Anciens* for an excellent help to Trees, to lay the Stalks and Leaves of *Lupines* about the Roots, or to Plough them into the Ground, where you will sow Corn. The burning also of the cuttings of Vines, and casting them upon Land, doth much good. And it was generally received of old, that dunging of Grounds when the West-wind bloweth, and in the decrease of the Moon, doth greatly help; the Earth (as it seemeth) being then more thirsty, and open to receive the Dung.

668. The Graffing of Vines upon Vines (as I take it) is not now in use. The *Anciens* had it, and that three ways; the first was *Infision*, which is the ordinary manner of Graffing; The second was *Terebration*, through the middle of the Stock, and putting in the Cions there: And the third was Paring of two Vines that grow together to the Marrow, and binding them close.

669. The Diseases and ill Accidents of Corn, are worthy to be enquired, and would be more worthy to be enquired, if it were in Mens power to help them; whereas many of them are not to be remedied. The Mildew is one of the greatest; which (out of question) cometh by closeness of Air; and therefore in Hills, or large Champain Grounds, it seldom cometh, such as is with us *York's Woald*. This cannot be remedied, otherwise then that in Countreys of small enclosure the Grounds be turned into larger Fields: Which I have known to do good in some Farms.

Another

Another Disease is the putting forth of Wilde Oats, whereinto Corn oftentimes (especially Barley) doth degenerate. It hapneth chiefly from the weakness of the Grain that is sown; for if it be either too old or mouldy, it will bring forth wilde Oats. Another disease is the satiety of the Ground; for if you sow one Ground still with the same Corn (I mean not the same Corn that grew upon the same Ground, but the same kinde of Grain, as Wheat, Barley, &c.) it will prosper but poorly; therefore besides the resting of the Ground, you must vary the Seed. Another ill Accident is from the Winds, which hurt at two times; at the flowering by shaking off the Flowers, and at the full ripening by shaking out the Corn. Another ill Accident is Drought at the spinning of the Corn, which with us is rare, but in hotter Countreys common, insomuch as the word *Calamitas* was first derived from *Calamus*, when the Corn could not get out of the stalk. Another ill Accident is Over-wet at sowing time, which with us breedeth much Dearth, insomuch as the Corn never cometh up; and (many times) they are forced to re-sow Summer-Corn, where they sowed Winter-Corn. Another ill Accident is bitter Frosts, continued without Snow, especially in the beginning of the Winter, after the Seed is new sown. Another Disease is Worms, which sometimes breed in the Root, and happen upon hot Suns and showers immediately after the sowing; and another Worm breedeth in the Ear it self, especially when hot Suns break often out of Clouds. Another Disease is Weeds; and they are such, as either choak and over-shadow the Corn, and bear it down, or starve the Corn, and deceive it of nourishment. Another Disease is, over-rankness of the Corn, which they use to remedy by Mowing it after it is come up, or putting Sheep into it. Another ill Accident is, laying of Corn with great Rains near or in Harvest. Another ill Accident is, if the Seed happen to have touched Oyl, or any thing that is fat; for those substances have an antipathy with nourishment of Water.

The remedies of the Diseases of Corn have been observed as followeth. The Steeping of the Grain before Sowing, a little time in Wine, is thought a preservative; the Mingling of Seed-Corn with Ashes, is thought to be good; the Sowing at the wane of the Moon, is thought to make the Corn sound. It hath not been practised, but it is thought to be of use to make some Mistle-lane in Corn; as if you sow a few Beans with Wheat, your Wheat will be the better. It hath been observed, that the sowing of Corn with Housleek doth good. Though Grain that toucheth Oyl or Fat receiveth hurt, yet the steeping of it in the Dregs of Oyl, when it beginneth to putrefie, (which they call *Amurca*) is thought to assure it against Worms. It is reported also, that if Corn be moved, it will make the Grain longer, but emptier, and having more of the Husk.

It hath been noted, that Seed of a year old is the best, and of two or three years is worse; and that which is more old is quite barren, though (no doubt) some Seed and Grain last better then others. The Corn which in the Vanning lieth lowest is the best; and the Corn which broken or bitten, retaineth a little yellowness, is better then that which is very white.

It hath been observed, that of all Roots of Herbs, the Root of Sorrel goeth the furthest into the Earth, insomuch as it hath been known to go three cubits deep; and that it is the Root that continueth fit (longest) to be set again, of any Root that groweth. It is a cold and acide Herb, that (as it seemeth) loveth the Earth, and is not much drawn by the Sun.

670.

671.

672.

673. It hath been observed, that some Herbs like best being watered with Salt-water; as *Radish, Beet, Rue, Penny royal*. This tryal would be extended to some other Herbs; especially such as are strong, as *Tarragon, Mustard-seed, Rocket*, and the like.

674. It is strange, that it is generally received, how some poysonous Beasts affect odorate and wholesome Herbs; as, that the *Snake* loveth *Fennel*, that the *Toad* will be much under *Sage*, that *Frogs* will be in *Cinquefoil*. It may be it is rather the Shade, or other Coverture, that they take liking in, then the virtue of the Herb.

675. It were a matter of great profit, (save that I doubt it is too conjectural to venture upon) if one could discern what Corn, Herbs, or Fruits, are like to be in Plenty or Scarcity, by some Signs and Prognosticks in the beginning of the year: For as for those that are like to be in Plenty, they may be bargained for upon the Ground; as the old relation was of *Thales*, who to shew how easie it was for a Philosopher to be rich, when he forelaw a great plenty of Olives, made a Monopoly of them. And for Scarcity, Men may make profit in keeping better the old store. Long continuance of Snow is believed to make a fruitful year of Corn; an early Winter, or a very late Winter, a barren year of Corn, an open and serene Winter, an ill year of Fruit. These we have partly touched before; but other Prognosticks of like nature are diligently to be enquired.

676. There seem to be in some Plants singularities, wherein they differ from all other. The Olive hath the oyle part onely on the outside, whereas all other Fruits have it in the Nut or Kernel. The Firr hath (in effect) no Stone, Nut, nor Kernel; except you will count the little Grains, Kernels. The Pomegranate and Pine-Apple have onely, amongst Fruits, Grains, distinct in severall Cells. No Herbs have curled Leaves, but Cabbage and Cabbage-Lettuce. None have double Leaves, one belonging to the Stalk, another to the Fruit or Seed, but the Artichoak. No Flower hath that kinde of spread that the Wood-bine hath. This may be a large Field of Contemplation; for it sheweth, that in the Frame of Nature there is, in the producing of some Species, a composition of Matter, which hapneth oft, and may be much diversified; in others, such as hapneth rarely, and admitteth little variety. For so it is likewise in Beasts; Dogs have a resemblance with Wolves and Foxes, Horses with Asses, Kine with Buffes, Hares with Coneyes, &c. And so in Birds; Kites and Kestrels have a resemblance with Hawks; Common Doves with Ring-Doves and Turtles; Black-Birds with Thrushes and Mavisses; Crows with Ravens, Daws, and Choughs, &c. But Elephants and Swine amongst Beasts, and the Bird of Paradise, and the Peacock amongst Birds, and some few others, have scarce any other Species that have affinity with them.

We leave the Description of *Plants* and their Virtues to *Herbals*, and other like Books of *Natural History*, wherein Mens diligence hath been great, even to Curiosity. For our *Experiments* are onely such, as do ever ascend a degree to the deriving of Causes, and extracting of Axioms, which we are not ignorant, but that some, both of the *Ancient* and *Modern* *Vvisers* have also labored; but their Causes and Axioms are so full of Imagination, and so infected with the old received *Theories*, as they are meer Inquinations of Experience, and concoct it not.

IT hath been observed by some of the *Ancients*, that Skins, especially of *Rams* newly pulled off, aed applied to the Wounds of Stripes, do keep them from swelling and exulcerating, and likewise heal them, and clothe them up; and that the Whites of Eggs do the same. The cause is, a temperate Conglutination; for both Bodies are clammy and viscous, and do bridle the Deflux of Humors to the hurts, without penning them in too much.

677.
Experiment
Solitary,
touching
Healing of
Wounds.

YOU may turn (almost) all Flesh into a fatty substance, if you take Flesh and cut it into pieces, and put the pieces into a Glass covered with Parchment, and so let the Glass stand six or seven hours in boiling Water. It may be an experiment of profit, for making of Fat or Grease for many uses: But then it must be of such Flesh as is not edible; as *Horses, Dogs, Bears, Foxes, Badgers, &c.*

678.
Experiment
Solitary,
touching
Fat diffused in
Flesh.

IT is reported by one of the *Ancients*, that new Wine put into Vessels well stopped, and the Vessels let down into the Sea, will accelerate very much the making of them ripe and potable; the same would be tryed in Wort.

679.
Experiment
Solitary,
touching
Ripening of
Drink before
the time.

BEASTS are more Hairy then Men; and Savage Men more then Civil; and the Plumage of Birds exceedeth the Pilosity of Beasts. The cause of the smoothness in Men, is not any abundance of Heat and Moisture, though that indeed causeth Pilosity; but there is requisite to Pilosity, not so much Heat and Moisture, as Excrementitious Heat and Moisture; (for whatsoever assimilateth goeth not into the Hair) and Excrementitious Moisture aboundeth most in Beasts, and Men that are more savage. Much the same Reason is there of the Plumage of Birds; for Birds assimilate less, and excern more then Beasts, for their Excrements are ever aliquid, and their Flesh (generally) more dry; beside, they have not Instruments for Urine, and so all the Excrementitious Moisture goeth into the Feathers: And therefore it is no marvel though Birds be commonly better Meat then Beasts, because their flesh doth assimilate more finely, and se-cerneth more subtilly. Again, the Head of Man hath Hair upon the first Birth, which no other part of the Body hath. The cause may be want of Perspiration; for much of the matter of Hair, in the other parts of the Body goeth forth by insensible Perspiration. And besides, the Skull being of a more solid substance, nourisheth and assimilateth less, and excerneth more; and so likewise doth the Chin. We see also that Hair cometh not upon the Palms of the Hands, nor Soals of the Feet, which are parts more perspirable. And Children likewise are not Hairy, for that their Skins are more perspirable.

680.
Experiment
Solitary,
touching
Pilosity and
Plumage.

BIRDS are of swifter motion then Beasts; for the flight of many Birds is swifter then the race of any Beasts. The cause is, for that the Spirits in Birds are in greater proportion, in comparison of the bulk of their Body, then in Beasts. For as for the reason that some give, that they are partly carried, whereas Beasts go, that is nothing; for by that reason, swimming should be swifter then running: And that kinde of carriage also, is not without labor of the Wing.

681.
Experiment
Solitary,
touching the
Quickness of
Motion in
Birds.

682.

Experiment
Solitary,
touching the
Different
clearness of the
Sea.

THe *Sea* is clearer when the North-wind bloweth, then when the South-wind. The cause is, for that *Salt-water* hath a little Oyliness in the Surface thereof, as appeareth in very hot days: And again, for that the Southern-wind relaxeth the Water somewhat; as no Water boyling, is so clear as cold Water.

683.

Experiment
Solitary,
touching the
Different
Heats of Fire
and Boiling
Water.

Fire burneth *Wood*, making it first Luminous, then black and brittle, and lastly, broken and incinerate; scalding Water doth none of these. The cause is, for that by Fire the Spirit of the Body is first refined, and then emitted; whereof the refining or attenuation causeth the light, and the emission; first the fragility, and after the dissolution into Ashes, neither doth any other Body enter. But in Water, the Spirit of the Body is not refined so much; and besides, part of the Water entreth, which doth increase the Spirit, and in a degree extinguish it; therefore we see that hot Water will quench Fire. And again, we see that in Bodies wherein the Water doth not much enter, but onely the heat passeth, hot Water worketh the effects of Fire: As in Eggs boiled and roasted, (into which the Water entreth not at all) there is scarce difference to be discerned; but in Fruit and Flesh, whereinto the Water entreth in some part, there is much more difference.

684.

Experiment
Solitary,
touching the
Qualification
of Heat by
Moisture.

THe bottom of a Vessel of boyling Water (as hath been observed) is not very much heated, so as men may put their hand under the Vessel, and remove it. The cause is, for that the moisture of Water, as it quencth Coals where it entreth, so it doth allay heat where it toucheth. And therefore note well, that moisture, although it doth not pass through Bodies without Communication of some substance (as heat and cold do) yet it worketh manifest effects; not by entrance of the Body, but by qualifying of the heat and cold, as we see in this instance. And we see likewise, that the water of things distilled in water, (which they call the *Bath*) differeth not much from the water of things distilled by Fire. We see also, that Pewter-Dishes with Water in them will not melt easily, but without it they will. Nay, we see more, that Butter or Oyl, which in themselves are inflamable, yet by the virtue of their moisture will do the like.

685.

Experiment
Solitary,
touching
Yawning.

IT hath been noted by the *Ancients*, that it is dangerous to pick ones Ear whilest he Yawneth. The cause is, for that in Yawning, the inner Parchment of the Ear is extended by the drawing in of the Spirit and Breath; for in Yawning and Sighing both, the Spirit is first strongly drawn in, and then strongly expelled.

686.

Experiment
Solitary,
touching the
Hiccough.

IT hath been observed by the *Ancients*, that Sneezing doth cease the Hiccough. The cause is, for that the Motion of the Hiccough is a lifting up of the Stomach; which Sneezing doth somewhat depress, and divert the motion another way. For first, we see that the Hiccough cometh of fulness of Meat, (especially in Children) which causeth an extension of the Stomach: We see also, it is caused by acide Meats or Drinks, which is by the pricking of the Stomach. And this motion is ceased, either by Diversion, or by Detention of the Spirits: Diversion, as in Sneezing; Detention, as we see holding of the Breath doth help somewhat to cease the Hiccough, and putting a Man into an earnest study doth the like, as is commonly used: And Vinegar put to the Nostrils or Gargarized doth it also; for that it is Astringent, and inhibiteth the motion of the Spirit.

Looking against the Sun doth induce Sneezing: The cause is, not the heating of the Nostrils; for then the holding up of the Nostrils against the Sun, though one wink, would do it, but the drawing down of the moisture of the Brain: For it will make the Eyes run with water, and the drawing of moisture to the Eyes, doth draw it to the Nostrils by Motion of Consent, and so followeth Sneezing. As contrariwise, the Tickling of the Nostrils within doth draw the moisture to the Nostrils, and to the Eyes by consent, for they also will water. But yet it hath been observed, that if one be about to sneeze, the rubbing of the Eyes till they run with water, will prevent it. Whereof the cause is, for that the humor which was descending to the Nostrils, is diverted to the Eyes.

The Teeth are more by cold drink, or the like, affected, then the other parts. The cause is double; the one, for that the resistance of Bone to cold, is greater then of Flesh; for that the Flesh shrinketh, but the Bone resisteth, whereby the Cold becometh more eager. The other is, for that the Teeth are parts without Blood, whereas Blood helpeth to qualifye the cold. And therefore we see, that the Sinews are much affected with Cold, for that they are parts without Blood. So the Bones in sharp Colds wax brittle; and therefore it hath been seen, that all contusions of Bones in hard weather, are more difficult to cure.

IT hath been noted, that the Tongue receiveth more easily tokens of Diseases then the other parts; as of heats within, which appear most in the blackness of the Tongue. Again, Pied Cattel are spotted in their Tongues, &c. The cause is (no doubt) the tenderness of the part, which thereby receiveth more easily all alterations then any other parts of the Flesh.

When the Mouth is out of taste, it maketh things taste sometimes salt, chiefly bitter, and sometimes loathsome, but never sweet. The cause is, the corrupting of the moisture about the Tongue, which many times turneth bitter, and salt, and loathsome, but sweet never; for the rest are degrees of corruption.

IT was observed in the *Great Plague* of the last year, that there were seen in divers Ditches, and low Grounds about *London*, many Toads that had Tails two or three inches long at the least, whereas Toads (usually) have no Tails at all; which argueth a great disposition to putrefaction in the Soil and Air. It is reported likewise, that Roots (such as *Carrots* and *Parsnips*) are more sweet and luscious in infectious years then in other years.

Wise Physicians should with all diligence inquire what Simples Nature yieldeth, that have extream subtile parts without any Mordication or Acrimony; for they undermine that which is hard, they open that which is stopped and shut, and they expel that which is offensive gently, without too much perturbation. Of this kinde are *Elder-flowers*, which therefore are proper for the Stone; of this kinde is the *Dwarf-pine*, which is proper for the Jaundies; of this kinde is *Harris-horn*, which is proper for Agues and Infections; of this kinde is *Piony*, which is proper for Stoppings in the Head; of this kinde is *Famitory* which is proper for the Spleen; and

and a number of others. Generally, divers Creatures bred of Putrefaction, though they be somewhat loathsome to take, are of this kinde; as *Earth-worms*, *Timber-sons*, *Snails*, &c. And I conceive, that the *Trochiscs* of *Vipers*, (which are so much magnified) and the flesh of Snakes some ways condited and corrected (which of late are grown into some credit) are of the same nature. So the parts of Beasts putrefied (as *Castoreum* and *Musk*, which have extream subtil parts) are to be placed amongst them. We see also, that putrefaction of Plants (as *Agarick* and *Jews-Ear*) are of greatest vertue. The cause is, for that putrefaction is the subtillest of all motions in the parts of Bodies, And since we cannot take down the lives of Living Creatures (which some of the *Paracelsians* say, if they could be taken down, would make us Immortal;) the next is, for subtilty of operation to take Bodies putrefied, such as may be safely taken.

693.
Experiments
in Confort,
touching
Venus.

IT hath been observed by the *Ancients*, that much use of *Venus* doth dim the sight, and yet *Eunuchs*, which are unable to generate, are (nevertheless) also dim-sighted. The cause of dimness of sight in the former, is the expence of Spirits; in the latter, the over-moisture of the Brain; for the over-moisture of the Brain doth thicken the Spirits visual, and obstructeth their passages, as we see by the decay in the sight in Age, where also the diminution of the Spirits concurrereth as another cause. We see also, that blindness cometh by Rheums and Cataracts. Now in *Eunuchs* there are all the notes of moisture; as the swelling of their Thighs, the looseness of their Belly, the smoothness of their skin, &c.

694.

The pleasure in the Act of *Venus*, is the greatest of the pleasures of the Senses; the matching of it with Itch is improper, though that also be pleasing to the touch, but the causes are profound. First, all the Organs of the Senses qualifie the motions of the Spirits, and make so many several species of motions, and pleasures or displeasures thereupon, as there be diversities of Organs. The Instruments of *Sight*, *Hearing*, *Taste*, and *Smell*, are of several frame, and so are the parts for Generation; therefore *Scaliger* doth well to make the pleasure of Generation a *sixth Sense*. And if there were any other differing Organs, and qualified Perforations for the Spirits to pass, there would be more then the *Five Senses*: Neither do we well know, whether some Beasts and Birds have not *Senses* that we know not, and the very Sent of Dogs is almost a sense by itself. Secondly, the Pleasures of the Touch are greater and deeper then those of the other *Senses*, as we see in *Warming* upon *Cold*, or *Refrigeration* upon *Heat*: For as the Pains of the Touch are greater then the offences of other Senses, so likewise are the Pleasures. It is true, that the affecting of the Spirits immediately, and (as it were) without an Organ, is of the greatest pleasure; which is but in two things, *Sweet smells* and *Wine*, and the like *Sweet vapors*. For Smells, we see their great and sudden effect in fetching Men again when they swoon; for Drink, it is certain, that the pleasure of Drunkenness is next the pleasure of *Venus*; and great Joyes (likewise) make the Spirits move and touch themselves; and the pleasure of *Venus* is somewhat of the same kinde.

695.

It hath been always observed, that Men are more inclined to *Venus* in the Winter, and Women in the Summer. The cause is, for that the Spirits in a Body more hot and dry, (as the Spirits of Men are) by the Summer are more exhaled and dissipated, and in the Winter more condensed and kept entire; but in Bodies that are cold and moist, (as Womens are) the Summer doth

doth cherish the Spirits, and calleth them forth, the Winter doth dull them. Furthermore, the Abstinence or Intermiſſion of the uſe of *Venus*, in moiſt and well habituate Bodies, breedeth a number of Diſeaſes; and eſpecially dangerous impoſthumations. The reaſon is evident, for that it is a principall evacuation, eſpecially of the Spirits; for of the Spirits, there is ſcarce any evacuation, but in *Venus* and exerciſe. And therefore the omiſſion of either of them breedeth all diſeaſes of Repletion.

THe nature of Vivification is very worthy the enquiry; and as the Nature of things is commonly better perceived in ſmall then in great, and in unperfect then in perfect, and in parts then in whole; ſo the Nature of Vivification is beſt enquired in Creatures bred of Putrefaction. The contemplation whereof hath many excellent Fruits. Firſt, in diſcloſing the original of Vivification. Secondly, in diſcloſing the original of Figuration. Thirdly, in diſcloſing many things in the nature of perfect Creatures, which in them lie more hidden. And fourthly, in traducing by way of operation, ſome obſervations in the *Inſecta*, to work effects upon perfect Creatures. Note, that the word *Inſecta* agreeth not with the matter, but we ever uſe it for brevities ſake, intending by it Creatures bred of Putrefaction.

Experiments
in Confort,
touching the
Inſecta.

The *Inſecta* are found to breed out of ſeveral matters: Some breed of Mud or Dung; as the *Earth-worms*, *Eels*, *Snakes*, &c. For they are both Putrefactions: For Water in Mud do putrefie, as not able to preſerve it ſelf; and for Dung, all Excrements are the reſuſe and putrefactions of nourishment. Some breed in Wood, both growing and cut down. *Quere*, in what Woods moſt, and at what ſeaſons. We ſee that the Worms with many feet, which round themſelves into Balls, are bred chiefly under Logs of *Timber*, but not in the *Timber*, and they are ſaid to be found alſo (many times) in Gardens where no Logs are. But it ſeemeth their Generation requireth a coverture both from Sun, and Rain or Dew, as the *Timber* is; and therefore they are not venomous, but (contrariwiſe) are held by the Phyſitians to clarify the Blood. It is obſerved, that *Cimices* are found in the holes of Bedſides. Some breed in the Hair of Living Creatures; as *Lice* and *Ticks*, which are bred by the ſweat cloſe kept, and ſomewhat airified by the Hair. The Excrements of Living Creatures do not onely breed *Inſecta* when they are excerned, but alſo while they are in the Body; as in Worms, whereto Children are moſt ſubject, and are chiefly in the Guts. And it hath been lately obſerved by Phyſitians, that in many *Peſtilent Diſeaſes* there are Worms found in the upper parts of the Body, where Excrements are not, but onely humors putrefied. *Fleas* breed principally of Straw or Mats, where there hath been a little moiſture, or the Chamber and Bed-ſtraw kept cloſe, and not aired. It is received, that they are killed by ſtrewing Wormwood in the Rooms. And it is truly obſerved, that bitter things are apt rather to kill then engender Putrefaction, and they be things that are fat or ſweet that are apteſt to putrefie. There is a Worm that breedeth in Meal of the ſhape of a large white Maggot, which is given as a great dainty to Nighthales. The Moth breedeth upon Cloth, and other Lanifices, eſpecially if they be laid up dankiſt and wet. It delighteth to be about the flame of a Candle. There is a Worm called a *Wevil*, bred under Ground, and that feedeth upon Roots, as Parſnips, Carrots, &c. Some breed in Waters, eſpecially ſhaded, but they muſt be by ſtanding Waters; as the Water-Spider that hath ſix Legs. The Fly called the *Gad ſie* breedeth of ſomewhat that ſwimeth upon the top of the Water, and

696.

is most about Ponds. There is a Worm that breedeth of the Dregs of Wine decayed, which afterwards (as is observed by some of the *Ancients*) turneth into a *Gnat*. It hath been observed by the *Ancients*, that there is a Worm that breedeth in old Snow, and is of colour reddish, and dull of motion, and dieth soon after it cometh out of Snow; which should shew that Snow hath in it a secret warmth, for else it could hardly vivifie. And the reason of the dying of the Worm may be the sudden exhaling of that little Spirit, as soon as it cometh out of the cold, which had shut it in. For as Butter-flies quicken with heat, which were benumbed with cold; so Spirits may exhale with heat, which were preserved in cold. It is affirmed, both by the *Ancient* and *Modern* observation, that in Furnaces of Copper and Brass, where Chalcites is (which is Vitriol) often cast in to mend the working, there riseth suddenly a Fly which sometimes moveth, as if it took hold on the Walls of the Furnace; sometimes is seen moving in the fire below, and dieth presently as soon as it is out of the Furnace. Which is a noble instance, and worthy to be weighed; for it sheweth that as well violent heat of fire, as the gentle heat of Living Creatures will vivifie, if it have matter proportionable. Now the great axiom of Vivification is, that there must be heat to dilate the Spirit of the Body, an Active Spirit to be dilated, matter viscous or tenacious to hold in the Spirit, and that matter to be put forth and figured. Now a Spirit dilated by so ardent a fire as that of the Furnace, as soon as ever it cooleth never so little, congealeth presently. And (no doubt) this action is furthered by the Chalcites, which hath a Spirit that will put forth and germinate, as we see in Chymical Tryals. Briefly, most things putrefied bring forth *Insecta* of several names; but we will not take upon us now to enumerate them all.

697.

The *Insecta* have been noted by the *Ancients* to feed little: But this hath not been diligently observed; for Grasshoppers eat up the Green of whole Countreys, and Silk-worms devour Leaves swiftly, and Ants make great provision. It is true, that Creatures that sleep and rest much, eat little, as Dormice and Bats, &c. they are all without Blood; which may be, for that the Juice of their Bodies is almost all one, not Blood, and Flesh, and Skin, and Bone, as in perfect Creatures: The integral parts have extream variety, but the similar parts little. It is true, that they have (some of them) Diaphragm, and an Intestine; and they have all Skins, which in most of the *Insecta*, are cast often. They are not (generally) of long life; yet Bees have been known to live seven years; and Snakes are thought, the rather for the casting of their spoil, to live till they be old; and Eels, which many times breed of putrefaction, will live and grow very long; and those that enterchange from Worms to Flies in the Summer, and from Flies to Worms in the Winter, have been kept in Boxes four years at the least; yet there are certain Flies that are called *Ephemera* that live but a day. The cause is, the exility of the Spirit, or perhaps the absence of the Sun; for that if they were brought in, or kept close, they might live longer. Many of the *Insecta* (as Butter-flies and other Flies) revive easily, when they seem dead, being brought to the Sun or Fire. The cause whereof is, the diffusion of the Vital Spirit, and the easie dilating of it by a little heat. They stir a good while after their heads are off, or that they be cut in pieces; which is caused also, for that their Vital Spirits are more diffused throughout all their parts, and less confined to Organs than in perfect Creatures.

698.

The *Insecta* have voluntary Motion, and therefore imagination. And whereas some of the *Ancients* have said, that their Motion is indeterminate, and their imagination indefinite, it is negligently observed; for Ants go right forwards.

forwards to their Hills; and *Bees* do (admirably) know the way from a Floury Heath, two or three miles off to their Hives. It may be *Gnats* and *Flies* have their Imagination more mutable and giddy, as small *Birds* likewise have. It is said by some of the Ancients, that they have onely the *Sense of Feeling*, which is manifestly untrue; for if they go forth right to a place, they must needs have *Sight*: Besides, they delight more in one Flower or Herb, then in another, and therefore have taste. And *Bees* are called with sound upon Brasses, and therefore they have hearing. Which sheweth likewise, that though their Spirits be diffused, yet there is a Seat of their Senses in their Head.

Other observations concerning the Insecta, together with the Enumeration of them, we refer to that place where we mean to handle the Title of Animals in general.

A Man leapeth better with weights in his hands, then without. The cause is, for that the weight (if it be proportionable) strengtheth the Sinews, by contracting them; for otherwise, where no contraction is needful, weight hindreth. As we see in *Horse Races*, Men are curious to foresee that there be not the least weight upon the one Horse more then upon the other. In Leaping with Weights, the Arms are first cast backward, and then forwards, with so much the greater force; for the hands go backward before they take their raise. *Quare*, if the contrary motion of the Spirits, immediately before the Motion we intend, doth not cause the Spirits as it were to break forth with more force; as Breath also drawn, and kept in, cometh forth more forcibly: And in casting of any thing, the Arms, to make a greater swing, are first cast backward.

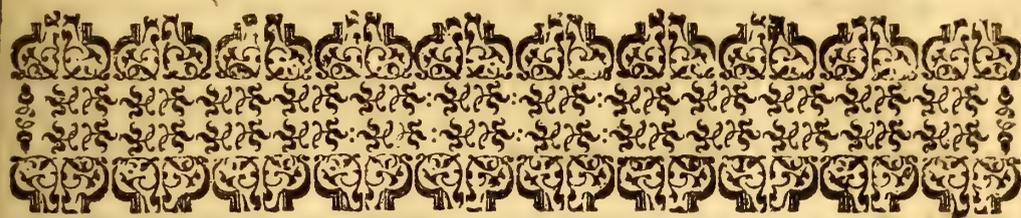

OF *Musical Tones* and unequal Sounds, we have spoken before, but touching the pleasure and displeasure of the Senses not so fully. Harsh Sounds, as of a *Saw* when it is sharpned, Grinding of one Stone against another, squeaking or screeching noises, make a shivering or horror in the Body, and set the Teeth on edge. The cause is, for that the objects of the Ear do affect the Spirits (immediately) most with pleasure and offence. We see there is no colour that affecteth the Eye much with displeasure. There be sights that are horrible, because they excite the memory of things that are odious or fearful; but the samethings painted, do little affect. As for *Smells*, *Tastes*, and *Touches*, they be things that do affect by a Participation or Impulsion of the body of the Object. So it is *Sound* alone that doth immediately and incorporeally affect most. This is most manifest in *Musick*, and *Concords*, and *Discords* in *Musick*: For all Sounds, whether they be sharp or flat, if they be sweet, have a roundness and equality; and if they be harsh, are unequal: For a *Discord* it self, is but a harshness of divers sounds meeting. It is true, that inequality, not staid upon, but passing, is rather an increase of sweetness; as in the Purling of a Wreathed String, and in the raucity of a *Trumpet*, and in the *Nightingale-Pipe* of a *Regal*, and in a *Discord* straight falling upon a *Concord*: But if you stay upon it, it is offensive. And therefore there be these three degrees of pleasing and displeasing in Sounds; *Sweet sounds*, *Discords*, and *Harsh sounds*, which we call by divers names, as *Screeching*, or *Grating*, such as we now speak of. As for the setting of the Teeth on edge, we plainly see what an intercourse there is between the Teeth, and the Organ of the Hearing, by the taking of the end of a Bow between the Teeth, and striking upon the String.

1870

NATURAL HISTORY.

Century VIII.

Here be *Minerals* and *Fossiles* in great variety, but of *Veins of Earth Medicinal* but few. The chief are, *Terra Lemnia*, *Terra Sigillata communis*, and *Bolus Arminus*; whereof *Terra Lemnia* is the chief. The Vertues of them are for *Curing of Wounds*, *Stanching of Blood*, *Stopping of Fluxes and Rheums*, and *Arresting the Spreading of Poyson, Infection, and Putrefaction*: And they have of all other *Simples* the perfectest and purest quality of *Drying*, with little or no mixture of any other quality. Yet it is true, that the *Bole Arminick* is the most cold of them, and that *Terra Lemnia* is the most hot; for which cause the *Island Lemnos* where it is digged, was in the old *Fabulous Ages* consecrated to *Vulcan*.

About the Bottom of the *Sereights* are gathered great quantities of *Sponges*, which are gathered from the sides of *Rocks*, being as it were a large, but tough *Moss*. It is the more to be noted, because that there be but few *Substances*, *Plant-like*, that grow deep within the *Sea*, for they are gathered sometime *Fifteen fathom deep*: And when they are laid on *Shore*, they seem to be of great *Bulk*; but crushed together, will be transported in a very *small room*.

IT seemeth that *Fish* that are used to the *Salt-water*, do nevertheless delight more in *fresh*. We see that *Salmons* and *Smelts* love to get into *Rivers*, though it be against the *Stream*. At the *Haven of Constantinople* you shall have great quantities of *Fish* that come from the *Euxine Sea*, that when they come into the *Fresh-water*, do inebriate and turn up their *Bellies*, so as you may take them with your hand. I doubt there hath not been sufficient Ex-

touching
*Sea-Fish put
in Fresh wa-
ters.*

periment made of putting *Sea fish* into Fresh-water, Ponds, and Pools. It is a thing of great use and pleasure; for so you may have them new at some good distance from the Sea: And besides, it may be the Fish will eat the pleasanter, and may fall to breed. And it is said, that *Colchester Oysters*, which are put into Pits, where the Sea goeth and cometh, (but yet so that there is a Fresh-water coming also to them when the Sea voideth) become by that means fatter, and more grown.

704.
Experiment
Solitary,
touching
*Attraction by
Similitude of
Substance.*

THE *Turkish Bow* giveth a very forcible Shoot, insomuch as it hath been known, that the *Arrow* hath pierced a Steel Target, or a piece of Brass of two Inches thick: But that which is more strange, the *Arrow*, if it be headed with Wood, hath been known to pierce through a piece of Wood of eight Inches thick. And it is certain, that we had in use at one time, for Sea-fight, short *Arrows*, which they called *Sprights*, without any other Heads, save Wood sharpened; which were discharged out of Muskets, and would pierce through the sides of Ships, where a Bullet would not pierce. But this dependeth upon one of the greatest secrets in all Nature; which is, that *Similitude of Substance* will cause Attraction, where the Body is wholly freed from the Motion of Gravity: For if that were taken away, *Lead* would draw *Lead*, and *Gold* would draw *Gold*, and *Iron* would draw *Iron* without the help of the *Load-stone*. But this same Motion of Weight or Gravity (which is a meer Motion of Matter, and hath no affinity with the Form or Kinde) doth kill the other Motion, except it self be killed by a violent Motion; and in these instances of Arrows, for then the Motion of Attraction by Similitude of Substance beginneth to shew it self. But we shall handle this point of *Nature* fully in due place.

705.
Experiment
Solitary,
touching
*Certain drinks
in Turkey.*

THEY have in *Turky*, and the *East*, certain *Confections*, which they call *Servess*, which are like to *Candid Conserves*, and are made of *Sugar* and *Lemmons*, or *Sugar* and *Citrons*, or *Sugar* and *Violets*, and some other Flowers; and some mixture of *Amber* for the more delicate persons: And those they dissolve in Water, and thereof make their Drink, because they are forbidden Wine by their Law. But I do much marvel, that no *Englishman*, or *Dutchman*, or *German*, doth set up *Brewing* in *Constantinople*, considering they have such quantity of *Barley*. For as for the general sort of Men, frugality may be the cause of *Drinking Water*; for that it is no small saving to pay nothing for ones drink: But the better sort might well be at the cost. And yet I wonder the less at it, because I see *France*, *Italy*, or *Spain*, have not taken into use *Beer* or *Ale*; which (perhaps) if they did, would better both their *Healths* and their *Complexions*. It is likely it would be matter of great gain to any that should begin it in *Turkey*.

706.
Experiments
in Consort,
touching
Sweats.

IN *Bathing* in hot water, sweat (nevertheless) cometh not in the parts under the Water. The cause is, first, for that sweat is a kinde of *Colliquation*. And that kinde of *Colliquation* is not made either by an over-dry Heat, or an over-moist Heat. For over-moisture doth somewhat extinguish the Heat; as we see, that even hot water quenqueth Fire, and over-dry Heat shutteth the Pores. And therefore Men will sooner sweat covered before the Sun or Fire, then if they stood naked: And Earthen Bottles filled with hot water, do provoke in Bed a Sweat more daintily then *Brick-bats* hot. Secondly, Hot water doth cause *Evaporation* from the *Skin*; so as it spendeth the matter in those parts under the Water, before it issueth in

Sweat,

Sweat. Again, Sweat cometh more plentifully, if the Heat be increased by degrees, then if it be greatest at first, or equal. The cause is, for that the Pores are better opened by a gentle Heat, then by a more violent; and by their opening the Sweat, issueth more abundantly. And therefore Physicians may do well, when they provoke Sweat in Bed by Bottles, with a Decoction of *Sudorifick Herbs* in *Hot Water*, to make two degrees of Heat in the Bottles, and to lay in the Bed the less-heated first, and after half an hour the more-heated.

Sweat is salt in taste. The cause is, for that that part of the Nourishment which is fresh and sweet, turneth into Blood and Flesh; and the Sweat is onely that part which is separate and excerned. Blood also raw, hath some saltness more then Flesh; because the Assimilation into Flesh, is not without a little and subtile excretion from the Blood.

Sweat cometh forth more out of the upper parts of the Body then the lower. The reason is, because those parts are more replenished with Spirits, and the Spirits are they that put forth Sweat; besides, they are less fleshy, and Sweat issueth (chiefly) out of the parts that are less fleshy and more dry, as the Forehead and Brest.

Men sweat more in sleep then waking, and yet sleep doth rather stay other Fluxions, then cause them; as *Rheums*, *Loosness* of the *Body*, &c. The cause is, for that in *Sleep* the Heat and Spirits do naturally move inwards, and there rest. But when they are collected once within, the Heat becometh more violent and irritate, and thereby expelleth Sweat.

Cold Sweats are (many times) Mortal and near *Death*, and always ill and suspected; as in great *Fears*, *Hypochondriacal Passions*, &c. The cause is, for that *Cold Sweats* come by a relaxation or forsaking of the *Spirits*, whereby the Moisture of the Body, which Heat did keep firm in the parts, severeth and issueth out.

In those *Diseases* which cannot be discharged by *Sweat*, *Sweat* is ill, and rather to be stayed; as in *Diseases* of the *Lungs*, and *Fluxes* of the *Belly*; but in those *Diseases* which are expelled by *Sweat*, it easeth and lighteneth; as in *Agues*, *Pestilences*, &c. The cause is, for that *Sweat* in the latter sort is partly *Critical*, and sendeth forth the *Matter* that offendeth: But in the former, it either proceedeth from the Labor of the *Spirits*, which sheweth them oppressed; or from Motion of *Consent*, when *Nature* not able to expel the *Disease* where it is seated, moveth to an *Expulsion* indifferent over all the *Body*.

THE Nature of the *Gloworm* is hitherto not well observed. Thus much we see, that they breed chiefly in the hottest Months of *Summer*; and that they breed not in *Champaign*, but in *Bushes* and *Hedges*. Whereby it may be conceived, that the *Spirit* of them is very fine, and not to be refined but by *Summer heats*. And again, that by reason of the fineness, it doth easily exhale. In *Italy*, and the Hotter Countreys, there is a Flie they call *Lucciote*, that shineth as the *Gloworm* doth, and it may be is the *Flying-Gloworm*; but that Flie is chiefly upon *Fens* and *Marishes*. But yet the two former observations hold, for they are not seen but in the heat of *Summer*; and *Sedge*, or other Green of the *Fens* give as good shade as *Bushes*. It may be the *Gloworms* of the Cold Countreys ripen not so far as to be winged.

THE Passions of the *Minde* work upon the *Body* the impressions following. *Fear*, causeth *Paleness*, *Trembling*, the *Standing* of the *Hair* upright.

707.

708.

709.

710.

711.

712.

Experiment Solitary, touching the *Gloworm*.

713.

Experiments in Consort, touching the Impressions which the Passions of the *Minde* make upon the *Body*.

right, Starting, and Screeching. The Paleness is caused, for that the Blood runneth inward to succor the Heart. The Trembling is caused, for that through the flight of the Spirits inward, the outward parts are destituted, and not sustained. Standing upright of the Hair is caused, for that by shutting of the Pores of the Skin, the Hair that lyeth asloap must needs rise. Starting is both an apprehension of the thing feared, (and in that kinde it is a motion of shrinking;) and likewise an Inquisition in the beginning what the matter should be, (and in that kinde it is a motion of Erection;) and therefore when a Man would listen suddenly to any thing, he starteth; for the starting is an Erection of the Spirits to attend. Screeching is an appetite of expelling that which suddenly striketh the Spirits. For it must be noted, that many Motions, though they be unprofitable to expel that which hurteth, yet they are Offers of Nature, and cause Motions by Consent; as in Groaning, or Crying upon Pain.

714.

Grief and Pain, cause Sighing, Sobbing, Groaning, Screaming, and Roaring, Tears, Distorting of the Face, Grinding of the Teeth, Sweating. Sighing is caused by the drawing in of a greater quantity of Breath to refresh the Heart that laboreth; like a great draught when one is thirsty. Sobbing is the same thing stronger. Groaning, and Screaming, and Roaring, are caused by an appetite of Expulsion, as hath been said; for when the Spirits cannot expel the thing that hurteth in their strife to do it, by Motion of Consent they expel the Voice. And this is when the Spirits yield, and give over to resist; for if one do constantly resist Pain, he will not groan. Tears are caused by a Contraction of the Spirits of the Brain; which Contraction by consequence astringeth the Moisture of the Brain, and thereby sendeth Tears into the Eyes. And this Contraction or Compression causeth also Wringing of the Hands; for Wringing is a Gesture of Expression of Moisture. The Distorting of the Face is caused by a Contention, first, to bear and resist, and then to expel; which maketh the Parts knit first, and afterwards open. Grinding of the Teeth is caused (likewise) by a Gathering and Serring of the Spirits together to resist; which maketh the Teeth also to set hard one against another. Sweating is also a Compound Motion by the Labor of the Spirits, first to resist, and then to expel.

715.

Joy causeth a Chearfulness and Vigor in the Eyes, Singing, Leaping, Dancing, and sometimes Tears. All these are the effects of the Dilatation and coming forth of the Spirits into the outward parts, which maketh them more lively and stirring. We know it hath been seen, that Excessive sudden Joy hath caused present Death, while the Spirits did spread so much as they could not retire again. As for Tears, they are the effects of Compression of the Moisture of the Brain, upon Dilatation of the Spirits. For Compression of the Spirits worketh an Expression of the Moisture of the Brain by consent, as hath been said in Grief: But then in Joy it worketh it diversly, viz. By Propulsion of the Moisture, when the Spirits dilate, and occupy more room.

716.

Anger causeth Paleness in some, and the going and coming of the colour in others; also Trembling in some, Swelling, Foaming at the Mouth, Stamping, Bending of the Fist, Paleness, and Going, and Coming of the Colour, are caused by the Burning of the Spirits about the Heart; which to refresh themselves, call in more Spirits from the outward parts. And if the Paleness be alone, without sending forth the colour again, it is commonly joynd with some fear: But in many there is no Paleness at all, but contrariwise Redness about the Checks and Gills; which is by the sending forth of the
Spirits,

Spirits, in an appetite to Revenge. Trembling in Anger is likewise by a calling in of the Spirits, and is commonly when Anger is joynd with Fear. Swelling is caused both by a Dilatation of the Spirits by over-heating, and by a Liquefaction or Boiling of the Humors thereupon. Foaming at the Mouth is from the same cause, being an Ebullition. Stamping and Bending of the Fist are caused by an Imagination of the Act of Revenge.

Light Displeasure or Dislike causeth shaking of the Head, Frowning, and Knitting of the Brows. These effects arise from the same cause that Trembling and Horror do; namely, from the Retiring of the Spirits, but in a less degree. For the Shaking of the Head, is but a slow and definite Trembling; and is a Gesture of slight refusal: And we see also, that a dislike causeth often that Gesture of the Hand, which we use when we refuse a thing, or warn it away. The Frowning and Knitting of the Brows, is a Gathering or Serring of the Spirits, to resist in some measure. And we see also, this Knitting of the Brows will follow upon earnest Studying, or Cogitation of any thing, though it be without dislike.

Shame causeth Blushing, and casting down of the Eyes. Blushing is the Resort of Blood to the Face, which in the Passion of Shame, is the part that laboreth most. And although the Blushing will be seen in the whole Brest, if it be naked, yet that is but in passage to the Face. As for the casting down of the Eyes, it proceedeth of the Reverence a Man beareth to other Men, whereby, when he is ashamed, he cannot endure to look firmly upon others: And we see, that Blushing and the Casting down of the Eyes both, are more when we come before many; *Ore Pompeii quid mollius? Nunquam non coram pluribus erubuit;* and likewise, when we come before *Great* or *Reverend Persons*.

Pity causeth sometimes Tears, and a Flexion or Cast of the Eye aside. Tears come from the cause, that they do in Grief: For Pity is but Grief in anothers behalf. The Cast of the Eye, is a Gesture of Aversion or Lothness to behold the object of Pity.

Wonder causeth Astonishment, or an Immovable Posture of the Body, Casting up of the Eyes to Heaven, and Lifting up of the Hands. For Astonishment, it is caused by the Fixing of the Minde upon one object of Cogitation, whereby it doth not spaiate and transcur as it useth: For in Wonder the Spirits lie not, as in Fear; but onely settle, and are made less apt to move. As for the Casting up of the Eyes, and Lifting up of the Hands, it is a kinde of Appeal to the Deity, which is the Author, by Power and Providence of strange Wonders.

Laughing causeth a Dilatation of the Mouth and Lips; a continued Expulsion of the Breath, with the loud Noise, which maketh the Interjection of Laughing; Shaking of the Brest and Sides; Running of the Eyes with Water, if it be violent and continued. Wherein first it is to be understood, that Laughing is scarce (properly) a Passion, but hath his Source from the Intellect; for in Laughing, there ever precedeth a conceit of somewhat ridiculous. And therefore it is proper to Man. Secondly, that the cause of Laughing, is but a light touch of the Spirits, and not so deep an Impression as in other Passions. And therefore (that which hath no Affinity with the Passions of the Minde) it is moved, and that in great vehemency, onely by Tickling some parts of the Body. And we see, that Men even in a grieved state of Minde, yet cannot sometimes forbear Laughing. Thirdly, it is ever joynd with some degree of Delight: And therefore Exhilaration hath some Affinity with Joy, though it be much Lighter Motion. *Res severa est verum Gaudium.*

Fourthly;

717.

718.

719.

720.

721.

Fourthly, That the object of it is *Deformity, Absurdity, Shrewd turns*, and the like. Now to speak of the causes of the effects before-mentioned, whereunto these general-Notes give some light. For the Dilatation of the *Mouth and Lips*, continued Expulsion of the *Breath and Voice*, and Shaking of the *Breasts and Sides*; they proceed (all) from the Dilatation of the *Spirits*, especially being sudden. So likewise the *Running* of the *Eyes* with Water, (as hath been formerly touched, where we spake of the *Tears* of *Joy* and *Grief*) is an effect of Dilatation of the *Spirits*. And for *Suddenness*, it is a great part of the *Matter*: For we see that any *Shrewd turn* that lighteth upon another, or any *Deformity, &c.* moveth *Laughter* in the instant, which after a little time it doth not. So we cannot *Laugh* at any thing after it is stale, but whilest it is new. And even in *Tickling*, if you tickle the sides, and give warning, or give a hard or continued touch, it doth not move *Laughter* so much.

722.

Lust causeth a *Flagrancy* in the *Eys*, and *Priapism*. The cause of both these is, for that in *Lust* the *Sight* and the *Touch*, are the things desired; and therefore the *Spirits* resort to those parts which are most affected. And note well in general, (for that great use may be made of the observation) that (evermore) the *Spirits* in all *Passions* resort most to the parts that labor most, or are most affected. As in the last, which hath been mentioned, they resort to the *Eyes* and *Venerous parts*; in *Fear* and *Anger* to the *Heart*; in *Shame* to the *Face*; and in *Light dislikes* to the *Head*.

723.
Experiments
in Consort,
touching
Drunkennesß.

IT hath been observed by the *Ancients*, and is yet believed, That the *Sperm* of *Drunken-men* is unfruitful. The cause is, for that it is over-moistned, and wanteth *Spissitude*. And we have a merry saying, *That they that go drunk to Bed, get Daughters*.

724.

Drunken-men are taken with a plain Defect or Destitution in *Voluntary Motion*; they reel, they tremble, they cannot stand, nor speak strongly. The cause is, for that the *Spirits* of the *Wine* oppress the *Spirits Animal*, and occupate part of the place where they are, and so make them weak to move; and therefore *Drunken-men* are apt to fall asleep. And *Opiates* and *Stupefactives* (as *Poppy, Henbane, Hemlock, &c.*) induce a kinde of *Drunkennesß* by the grossness of their *Vapor*, as *Wine* doth by the quantity of the *Vapor*. Besides, they rob the *Spirits Animal* of their *Matter* whereby they are nourished; for the *Spirits* of the *Wine*, prey upon it as well as they, and so they make the *Spirits* less tuppel and apt to move.

725.

Drunken-men imagine every thing turneth round; they imagine also, that things come upon them; they see not well things afar off; those things that they see near hand, they see out of their place; and (sometimes) they see things double. The cause of the imagination that things turn round is, for that the *Spirits* themselves turn, being compressed by the *Vapor* of the *Wine*; (for any *Liquid Body* upon *Compression* turneth, as we see in *Water*;) And it is all one to the sight, whether the *Visual Spirits* move, or the *Object* moveth, or the *Medium* moveth; and we see, that long turning round breedeth the same imagination. The cause of the imagination that things come upon them is, for that the *Spirits Visual* themselves draw back, which maketh the *Object* seem to come on; and besides, when they see things turn round and move, *Fear* maketh them think they come upon them. The cause that they cannot see things afar off, is the weakness of the *Spirits*; for in every *Megrin* or *Vertigo*, there is an *Obtenebration* joynd with a semblance of *Turning round*, which we see also in the lighter sort of *Swoonings*.

The

The cause of seeing things out of their place, is the refraction of the Spirits visual; for the vapor is as an unequal *Medium*, and it is as the sight of things out of place in Water. The cause of seeing things double, is the swift and unquiet motion of the Spirits (being oppressed) to and fro; for (as was said before) the motion of the Spirits visual, and the motion of the object make the same appearances; and for the swift motion of the object, we see that if you fillip a *Lute* string, it sheweth double or trebble.

Men are sooner Drunk with small draughts then with great. And again, Wine sugared, inebriateth less then Wine pure: The cause of the former is, for that the Wine descendeth not so fast to the Bottom of the Stomack; but maketh longer stay in the upper part of the Stomack; and sendeth Vapors faster to the Head, and therefore inebriateth sooner. And for the same reason, Sops in Wine (quantity for quantity) inebriate more then Wine of it self. The cause of the latter is, for that the Sugar doth inspissate the Spirits of the Wine, and maketh them not so easie to resolve into Vapor. Nay further, it is thought to be some remedy against inebriating, if Wine sugared be taken after Wine pure. And the same effect is wrought; either by Oyl or Milk taken upon much Drinking.

THe use of Wine in dry and consumed Bodies is hurtful, in moist and full Bodies it is good. The cause is, for that the Spirits of the Wine do prey upon the Dew or radical moisture (as they term it) of the Body, and so deceive the Animal Spirits. But where there is moisture enough, or superfluous, there Wine helpeth to digest and desiccate the moisture.

THe *Caterpillar* is one of the most general of Worms, and breedeth of Dew and Leaves; for we see infinite number of *Caterpillers* which breed upon Trees and Hedges, by which the Leaves of the Trees or Hedges are in great part consumed; as well by their breeding out of the Leaf; as by their feeding upon the Leaf. They breed in the Spring chiefly, because then there is both Dew and Leaf. And they breed commonly when the East Winds have much blown: The cause whereof is, the dryness of that Wind; for to all Vivification upon Putrefaction, it is requisite the matter be not too moist: And therefore we see they have *Cobwebs* about them, which is a sign of a stimy dryness; as we see upon the Ground, whereupon by Dew and Sun *Cobwebs* breed all over. We see also the Green *Caterpillar* breedeth in the inward parts of *Roses*, especially not blown where the Dew sticketh: But especially *Caterpillers*, both the greatest and the most, breed upon *Cabbages*, which have a fat Leaf, and apt to putrifie. The *Caterpillar* toward the end of Summer waxeth volatile, and turneth to a *Butterflie*, or perhaps some other Flie. There is a *Caterpillar* that hath a Fur or Down upon him, and seemeth to have affinity with the *Silk Worm*.

THe *Flies Cantharides*, are bred of a *Worm* or *Caterpillar*; but peculiar to certain Fruit-trees; as are the Fig-tree, the Pine-tree, and the Wilde Bryar; all which bear sweet Fruit, and Fruit that hath a kinde of secret biting or sharpness. For the Fig hath a Milk in it that is sweet and corrosive; the Pine-Apple hath a Kernel that is strong and abstersive; the Fruit of the Bryar is said to make Children, or those that eat them, scabbed. And therefore no marvel though *Cantharides* have such a Corrosive and Cauterizing quality; for there is not one other of the *Insecta*, but is bred of a duller matter. The Body of the *Cantharides* is bright coloured; and it may

726.

727.

Experiment Solitary, touching the Help or hurt of Wine, though Moderately used.

728.

Experiment Solitary, touching *Caterpillers*.

729.

Experiment Solitary, touching the *Flies Cantharides*.

be, that the delicate coloured Dragon Flies may have likewise some Corrosive quality.

730.
Experiments
in Consort,
touching
Lassitude.

L *Astitude* is remedied by Bathing or Anointing with Oyl and warm Water. The cause is, for that all *Lassitude* is a kinde of Contusion and Compression of the Parts ; and Bathing and Anointing give a Relaxion or Emolition: And the mixture of Oyl and Water is better then either of them alone, because Water entreth better into the Pores, and Oyl after entry softneth better. It is found also, that the taking of *Tobacco* doth help and discharge *Lassitude*. The reason whereof is partly, because by chearing or comforting of the Spirits, it openeth the Parts compressed or contused: And chiefly, because it refresheth the Spirits by the Opiate Vertue thereof, and so dischargeth Weariness, as Sleep likewise doth.

731.

In going up a Hill the *Knees* will be most weary; in going down a Hill, *Thighs*. The cause is, for that in the Lift of the Feet, when a man goeth up the Hill, the weight of the Body beareth most upon the *Knees*; and in going down the Hill, upon the *Thighs*.

732.
Experiment
Solitary,
touching the
*Casting of the
Skin and Shell
in some Crea-
tures.*

T He casting of the *Skin*, is by the Ancients compared to the breaking of the *Secundine* or *Call*, but not rightly; for that were to make every casting of the *Skin* a new Birth: And besides, the *Secundine* is but a general Cover, not shaped according to the Parts; but the *Skin* is shaped according to the Parts. The *Creatures* that cast their *Skin* are, the *Snake*, the *Viper*, the *Grashopper*, the *Lizard*, the *Silk-worm*, &c. Those that cast their *Shell* are, the *Lobster*, the *Crab*, the *Cra-fish*, the *Hodmandod* or *Dodman*, the *Tortoise*, &c. The old *Skins* are found, but the old *Shells* never: So as it is like they scale off, and crumble away by degrees. And they are known by the extream tenderness and softness of the new *Shell*; and somewhat by the freshness of the colour of it. The cause of the casting and *Skin* and *Shell* should seem to be the great quantity of matter in those *Creatures*, that is fit to make *Skin* or *Shell*: And again, the looseness of the *Skin* or *Shell*, that sticketh not close to the *Flesh*. For it is certain, that it is the new *Skin* or *Shell* that putteth off the old. So we see that in *Deer*, it is the young *Horn* that putteth off the old. And in *Birds*, the young *Feathers* put off the old; and so *Birds* that have much matter for their *Beak*, cast their *Beaks*, the new *Beak* putting off the old.

733.
Experiments
in Consort,
touching the
*Postures of the
Body.*

Lying not Erect but Hollow, which is in the making of the Bed, or with the *Legs* gathered up, which is in the posture of the *Body*, is the more wholesome, The reason is, the better comforting of the *Stomack*, which is by that less pensile; and we see, that in weak *Stomacks*, the laying up of the *Legs* high, and the *Knees* almost to the *Mouth*, helpeth and comforteth. We see also, that *Gally-slaves*, notwithstanding their misery otherwise, are commonly fat and fleshy; and the reason is, because the *Stomack* is supported somewhat in sitting, and is pensile in standing or going. And therefore for Prolongation of *Life*, it is good to chuse those *Exercises* where the *Limbs* move more then the *Stomack* and *Belly*; as in *Rowing* and in *Sawing*, being set.

734.

Megrims and *Giddiness* are rather when we *Rise*, after long sitting, then while we sit. The cause is, for that the *Vapors* which were gathered by sitting, by the sudden *Motion* flie more up into the *Head*.

735.

Leaning upon any Part maketh it *Num*, and, as we call it, *Asleep*.
The

The cause is, for that the Compression of the Parts suffereth not the Spirits to have free access; and therefore, when we come out of it, we feel a tingling or pricking, which is the re-entrance of the Spirits.

IT hath been noted, That those Years are pestilential and unwholsome, when there are great numbers of Frogs, Flies, Locusts, &c. The cause is plain; for that those Creatures being ingendred of Putrefaction, when they abound, shew a general disposition of the Year, and constitution of the Air to Diseases of Putrefaction. And the same Prognostick (as hath been said before) holdeth, if you finde Worms in Oak-Apples. For the Constitution of the Air appeareth more subtilly in any of these things, then to the sense of Man.

736.
Experiment
Solitary,
touching
Pestilential
Years.

IT is an observation amongst Country people, that Years of store of *Haws* and *Heps*, do commonly portend cold Winters; and they ascribe it to Gods Providence, that (as the *Scripture* saith) reacheth even to the falling of a Sparrow; and much more is like to reach to the Preservation of Birds in such Seasons. The Natural cause also may be the want of Heat, and abundance of Moisture in the Summer precedent, which putteth forth those Fruits, and must needs leave great quantity of cold Vapors not dissipate, which causeth the cold of the Winter following.

737.
Experiment
Solitary,
touching the
Prognosticks of
Hard Winters.

They have in *Turkey* a Drink called *Coffee*, made of a Berry of the same name, as black as soot, and of a strong sent, but not aromatical, which they take, beaten into powder, in Water as hot as they can drink it: And they take it, and sit at it in their *Coffee-Houses*, which are like our Taverns. This Drink comforteth the Brain and Heart, and helpeth Digestion. Certainly this Berry *Coffee*, the Root and Leaf *Betel*, the Leaf *Tobacco*, and the Teare of *Poppy*, (*Opium*) of which, the *Turks* are great takers (supposing it expelleth all fear; do all condense the Spirits, and make them strong and aliger. But it seemeth they are taken after several manners; for *Coffee* and *Opium* are taken down, *Tobacco* but in *Smoak*, and *Betel* is but champed in the Mouth with a little *Lime*. It is like, there are more of them, if they were well found out, and well corrected. *Quere*, of *Henbane-seed*, of *Mandrake*, of *Saffron*, Root and Flower, of *Folium Indum*, of *Ambergreece*, of the *Assyrian Amomum*, if it may be had; and of the *Scarlet Powder* which they call *Kermes*; and (generally) of all such things as do inebriate and provoke sleep. Note, that *Tobacco* is not taken in Root or Seed, which are more forcible ever then Leaves.

738.
Experiment
Solitary,
touching
Medicine, that
Condense and
Relieve the
Spirits.

The *Turks* have a black Powder made of a Mineral called *Alcobole*, which with a fine long Pencil they lay under their Eye-lids, which doth colour them black, whereby the White of the Eye is set off more white. With the same Powder they colour also the Hairs of their Eye-lids, and of their Eye-brows, which they draw into embowed Arches. You shall finde that *Xenophon* maketh mention, that the *Medes* used to paint their Eyes. The *Turks* use with the same Tincture to colour the Hair of their Heads and Beards black: And divers with us that are grown Gray, and yet would appear young, finde means to make their Hair black, by combing it (as they say) with a Leaden Comb, or the like. As for the *Chineses*, who are of an ill Complexion (being *Olivaster*) they paint their Cheeks Scarlet, especially their *King* and *Grandeers*. Generally, *Barbarous People* that go naked, do not onely paint them-

739.
Experiment
Solitary,
touching
Paintings of
the Body.

themselves, but they pounce and rase their skin, that the Painting may not be taken forth, and make it into Works; So do the *West-Indians*; and so did the ancient *Picts* and *Britons*. So that it seemeth Men would have the colours of *Birds Feathers*, if they could tell how, or at least they will have gay Skins in stead of gay Cloaths.

740.
Experiment
Solitary,
touching the
Use of Bath-
ing and An-
ointing.

IT is strange that the use of *Bathing* as a part of *Diet* is left. With the *Romans* and the *Grecians* it was as usual as Eating or Sleeping; and so is it amongst the *Turks* at this day; whereas with us it remaineth but as a part of Physick. I am of opinion, that the use of it as it was with the *Romans*, was hurtful to health; for that it made the Body soft and easie to waste. For the *Turks* it is more proper, because their drinking Water, and feeding upon Rice, and other Food of small nourishment, maketh their Bodies so solid and hard, as you need not fear that *Bathing* should make them frothy. Besides, the *Turks* are great sitters, and seldom walk; whereby they sweat less, and need *Bathing* more. But yet certain it is, that *Bathing*, and especially *Anointing*, may be so used, as it may be a great help to Health, and Prolongation of Life. But hereof we shall speak in due place, when we come to handle *Experiments Medicinal*.

741.
Experiment
Solitary,
touching
Chamoletting
of Paper.

THE *Turks* have a pretty Art of *Chamoletting* of Paper, which is not with us in use. They take divers Oyled Colours, and put them severally (in drops) upon Water, and stir the Water lightly, and then wet their Paper (being of some thickness) with it; and the Paper will be waved and veined like *Chamolet* or *Marble*.

742.
Experiment
Solitary,
touching
Cuttle-Ink,

IT is somewhat strange, that the Blood of all Birds, and Beasts, and Fishes, should be of a Red colour, and onely the Blood of the Cuttle should be as black as Ink. A man would think that the cause should be the high Concoction of that Blood; for we see in ordinary Puddings, that the Boyling turneth the Blood to be black; and the Cuttle is accounted a delicate Meat, and is much in request.

743.
Experiment
Solitary,
touching
Encrease of
Weight in
Earth.

IT is reported of credit, That if you take *Earth* from Land adjoining to the River of *Nile*, and preserve it in that manner, that it neither come to be wet nor wasted, and weigh it daily, it will not alter weight until the Seventeenth of *June*, which is the day when the River beginneth to rise; and then it will grow more and more ponderous till the River cometh to his height. Which if it be true, it cannot be caused but by the Air, which then beginneth to condense; and so turneth within that small Mould into a degree of Moisture, which produceth weight. So it hath been observed, that *Tobacco* cut and weighed, and then dried by the Fire, loseth weight; and after being laid in the open Air, recovereth weight again. And it should seem, that as soon as ever the River beginneth to increase, the whole Body of the Air thereabouts suffereth a change: For (that which is more strange) it is credibly affirmed, that upon that very day, when the River first riseth, great Plagues in *Cairo* use suddenly to break up.

744.
Experiments
in Comfort,
touching
Sleep.

THose that are very cold, and especially in their Feet, cannot get to Sleep. The cause may be, for that in Sleep is required a free respiration, which cold doth shut in and hinder: For we see, that in great Colds, one can scarce draw

draw his Breath. Another cause may be, for that Cold calleth the Spirits to succor; and therefore they cannot so well close, and go together in the Head, which is ever requisite to Sleep. And for the same cause, Pain and noise hinder sleep, and darkness (contrariwise) furthereth sleep.

Some noises (whereof we spake in the 112 Experiment) help Sleep; as the blowing of the Wind, the trickling of Water, humming of Bees, soft singing, reading, &c. The cause is, for that they move in the Spirits a gentle attention; and whatsoever moveth attention, without too much labor, stilleth the natural and discursive motions of the Spirits.

Sleep nourisheth, or at least preserveth, Bodies a long time, without other nourishment. Beasts that sleep in Winter, (as it is noted of wilde Bears) during their sleep wax very fat, though they eat nothing. Bats have been found in Ovens, and other hollow close places, matted one upon another; and therefore it is likely that they sleep in the Winter time, and eat nothing. *Quare* whether Bees do not sleep all Winter, and spare their Honey. Butter-flies, and other Flies, do not onely sleep, but lie as dead all Winter; and yet with a little heat of Sun or Fire revive again. A Dormouse, both Winter and Summer will sleep some days together, and eat nothing.

TO restore Teeth in Age, were *Magnale Natura*; it may be thought of; but howsoever, the nature of the Teeth deserveth to be enquired of, as well as the other parts of Living Creatures Bodies.

There be five parts in the *Bodies of Living Creatures* that are of hard substances; the *Skull*, the *Teeth*, the *Bones*, the *Horns*; and the *Nails*. The greatest quantity of hard substance continued, is towards the Head; for there is the Skull of one entire Bone, there are the Teeth, there are *Maxillary Bones*, there is the hard Bone that is the Instrument of Hearing, and thence issue the *Horns*. So that the building of Living Creatures Bodies is like the building of a Timber-house; where the Walls and other parts have Columns and Beams; but the Roof is in the better sort of Houses, all Tile, or Lead, or Stone. As for *Birds*, they have three other hard substances proper to them; the *Bill*, which is of the like matter with the Teeth, for no Birds have Teeth; the Shell of the Egg, and their Quills; for as for their Spur, it is but a Nail. But no *Living Creatures* that have Shells very hard (as *Oysters*, *Cockles*, *Mussels*, *Shalops*, *Crabs*, *Lobsters*, *Craw-fish*, *Shrimps*, and especially the *Tortoise*) have *Bones* within them, but onely little *Gristles*.

Bones, after full growth, continue at a stay, and so doth the *Skull*. *Horns*, in some Creatures, are cast and renewed: Teeth stand at a stay, except their wearing. As for *Nails*, they grow continually, and *Bills* and *Beaks* will overgrow, and sometimes be cast, as in *Eagles* and *Parrots*.

Most of the hard substances lie to the extreame of the Body; as *Skull*, *Horns*, *Teeth*, *Nails*, and *Beaks*; onely the *Bones* are more inward, and clad with *Flesh*. As for the *Entrails*, they are all without *Bones*, save that a Bone is sometimes found in the *Heart* of a *Stag*, and it may be in some other Creatures.

The *Skull* hath *Brains*, as a kinde of *Marrow* within it. The *Back-bone* hath one kinde of *Marrow*, which hath an affinity with the Brain; and other *Bones* of the Body have another. The *Jaw-bones* have no *Marrow* severed, but a little *Pulp* of *Marrow* diffused. Teeth likewise are thought to have a kinde of *Marrow* diffused, which causeth the Sense and Pain: But it

745.

746.

Experiments
in Consort,
touching
Teeth and
hard Substan-
ces in the
Bodies of Li-
ving Crea-
tures.

747.

748.

749.

750.

is rather Sinew; for Marrow hath no Sense, no more then Blood. Horn is alike throughout, and so is the Nail.

751. None other of the hard substances have Sense, but the Teeth; and the Teeth have Sense, not onely of Pain, but of Cold.

But we will leave the *Enquiries* of other *Hard Substances* unto their severall places, and now enquire onely of the *Teeth*.

752. The *Teeth* are in Men of three kindes, *Sharp*, as the *Fore-teeth*; *Broad*, as the *Back-teeth*, which we call the *Molar-teeth*, or *Grinders*; and *Pointed-teeth*, or *Canine*, which are between both. But there have been some Men that have had their *Teeth* undivided, as of one whole *Bone*, with some little mark in the place of the Division, as *Pyrrhus* had. Some *Creatures* have over-long or out-growing *Teeth*, which we call *Fangs* or *Tusks*; as *Boars*, *Pikes*, *Salmons*, and *Dogs*, though less. Some *Living Creatures* have *Teeth* against *Teeth*, as *Men* and *Horses*; and some have *Teeth*, especially their *Master-teeth*, indented one within another like *Saws*, as *Lions*; and so again have *Dogs*. Some *Fishes* have divers Rows of *Teeth* in the *Roofs* of their *Mouths*; as *Pikes*, *Salmous*, *Trouts*, &c. and many more in *Salt-waters*. *Snakes* and other *Serpents* have venemous *Teeth*, which are sometimes mistaken for their *Sting*.

753. No *Beast* that hath *Horns* hath upper-teeth; and no *Beast* that hath *Teeth* above, wanteth them below. But yet if they be of the same kinde, it followeth not, that if the hard matter goeth not into upper-teeth, it will go into *Horns*; nor yet è *converso*, for *Does* that have no *Horns*, have no upper-teeth.

754. *Horses* have, at three years old, a *Tooth* put forth which they call the *Colts-tooth*; and at four years old, there cometh the *Mark-tooth*, which hath a hole so big as you may lay a *Pease* within it; and that weareth shorter and shorter every year, till that at eight years old the *Tooth* is smooth, and the hole gone; and then they say, That the *Mark* is out of the *Horses Mouth*.

755. The *Teeth* of *Men* breed first; when the *Childe* is about a year and half old, and then they cast them, and new come about seven years old. But divers have *Backward-teeth* come forth at twenty, yea, some at thirty, and forty. *Quare* of the manner of the coming of them forth. They tell a tale of the old *Countess* of *Desmond*, who lived till she was *Sevenscore* years old, that she did *Dentire* twice or thrice, casting her old *Teeth*, and others coming in their place.

756. *Teeth* are much hurt by *Sweet-meats*, and by *Painting* with *Mercury*, and by things over-hot, and by things over-cold, and by *Rheums*. And the pain of the *Teeth*, is one of the sharpest of pains.

757. Concerning *Teeth*, these things are to be considered. 1. The preserving of them. 2. The keeping of them white. 3. The drawing of them with least pain. 4. The staying and easing of the *Tooth-ach*. 5. The binding in of *Artificial Teeth*, where *Teeth* have been stricken out. 6. And last of all, that great one, of restoring *Teeth* in *Age*. The instances that give any likelihood of restoring *Teeth* in *Age*, are, The late coming of *Teeth* in some; and the renewing of the *Beaks* in *Birds*, which are commaterial with *Teeth*. *Quare* therefore more particularly how that cometh. And again, the renewing of *Horns*. But yet that hath not been known to have been provoked by *Art*; therefore let tryal be made, whether *Horns* may be procured to grow in *Beasts* that are not horned, and how; and whether they may be procured to come larger then usual, as to make an *Ox* or a *Deer* have

have a greater Head of Horns; and whether the Head of a Deer, that by age is more spitted, may be brought again to be more branched. For these tryals and the like will shew, Whether by art such hard matter can be called and provoked. It may be tryed also, whether Birds may not have something done to them when they are young, whereby they may be made to have greater or longer Bills, or greater and longer Talons: And whether Children may not have some Wash, or something to make their Teeth better and stronger. Coral is in use as an help to the Teeth of Children.

Some Living Creatures generate but at certain seasons of the year; as *Deer, Sheep, Wilde Conneys, &c.* and most sorts of *Birds and Fishes*: Others at any time of the year, as *Men*; and all Domestick Creatures, as *Horses, Hogs, Dogs, Cats, &c.* The cause of Generation at all seasons, seemeth to be Fulness; for Generation is from Redundance. This Fulness ariseth from two causes, Either from the Nature of the Creature, if it be Hot, and Moist, and Sanguine, or from Plenty of Food. For the first, *Men, Horses, Dogs, &c.* which breed at all seasons, are full of Heat and Moisture; *Doves* are the fullest of Heat and Moisture amongst *Birds*, and therefore breed often, the *Tame Dove* almost continually. But *Deer* are a Melancholick dry Creature, as appeareth by their fearfulness, and the hardness of their Flesh. *Sheep* are a cold Creature, as appeareth by their mildness, and for that they seldom drink. Most sorts of *Birds* are of a dry substance in comparison of *Beasts*; *Fishes* are cold. For the second cause, Fulness of Food, *Men, Kine, Swine, Dogs, &c.* feed full. And we see, that those Creatures which, being *Wilde*, generate seldom, being tame, generate often; which is from warmth and fulness of food. We finde that the time of going to *Rut* of *Deer* is in *September*, for that they need the whole Summers Feed and Grass to make them fit for Generation; and if Rain come early about the middle of *September*, they go to *Rut* somewhat the sooner; if *Drought*, somewhat the later. So *Sheep*, in respect of their small heat, generate about the same time, or somewhat before. But for the most part, Creatures that generate at certain seasons generate in the Spring; as *Birds and Fishes*: For that the end of the *Winter*, and the heat and comfort of the Spring prepareth them. There is also another reason why some Creatures generate at certain seasons, and that is the Relation of their time of Bearing to the time of Generation; for no Creature goeth to generate whilest the Female is full, nor whilest she is busie in sitting, or rearing her young; and therefore it is found by experience, that if you take the Eggs or Young-ones out of the Nests of *Birds*, they will fall to generate again three or four times one after another.

Of Living Creatures, some are longer time in the *Womb*, and some shorter. *Women* go commonly nine Moneths, the *Cow* and the *Ewe* about six Moneths, *Does* go about nine Moneths, *Mares* eleven Moneths, *Bitches* nine Weeks; *Elephants* are said to go two years, for the received Tradition of ten years is fabulous. For *Birds* there is double enquiry; the distance between the treading or coupling, and the laying of the Egg; and again, between the Egg laid, and the disclosing or hatching. And amongst *Birds* there is less diversity of time then amongst other Creatures, yet some there is; for the *Hen* sitteth but three weeks, the *Turkey-hen*, *Goose* and *Duck*, a moneth. *Quare* of others. The cause of the great difference of times amongst Living Creatures is, either from the nature of the Kind;

758.

Experiments
in Consort,
touching the
Generation
and Bearing
of Living
Creatures in
the Womb.

759.

or from the constitution of the Womb. For the former, those that are longer in coming to their maturity or growth, are longer in the Womb; as is chiefly seen in Men; and so Elephants, which are long in the Womb, are long time in coming to their full growth. But in most other Kinds, the constitution of the Womb (that is, the hardness or dryness thereof) is concurrent with the former cause. For the Colt hath about four years of growth, and so the Fawn, and so the Calf; but Whelps, which come to their growth (commonly) within three quarters of a year, are but nine weeks in the Womb. As for Birds, as there is less diversity amongst them in the time of their bringing forth, so there is less diversity in the time of their growth, most of them coming to their growth within a twelve-moneth.

760.

Some Creatures bring forth many young ones at a Burthen; as Bitches, Hares, Coneys, &c. some (ordinarily) but one; as Women, Lionesses, &c. This may be caused, either by the quantity of Sperm required to the producing one of that Kind; which if less be required, may admit greater number; if more, fewer: Or by the Partitions and Cells of the Womb, which may sever the Sperm.

761.

Experiments
in Consort,
touching
Species visible.

There is no doubt but Light by Refraction will shew greater, as well as things coloured; for like as a shilling in the bottom of the Water will shew greater, so will a Candle in a Lanthorn in the bottom of the Water. I have heard of a practice, that Glowworms in Glasses were put in the Water to make the Fish come. But I am not yet informed, whether when a Diver diueth, having his eyes open, and swimmeth upon his back, whether (I say) he seeth things in the Air, greater or less. For it is manifest, that when the eye standeth in the finer *medium*, and the object is in the grosser, things shew greater; but contrariwise, when the eye is placed in the grosser *medium*, and the object in the finer, how it worketh I know not.

762.

It would be well boulded out, whether great Refractions may not be made upon Reflexions, as well as upon direct beams. For example, we see, that take an empty Bason, put an *Angel of Gold*, or what you will into it; then go so far from the Bason till you cannot see the Angel, because it is not in a right Line; then fill the Bason with Water, and you shall see it out of his place, because of the Reflexion. To proceed therefore, put a Looking-glass into a Bason of Water; I suppose you shall not see the Image in a right Line, or at equal Angles, but aside. I know not whether this *Experiment* may not be extended so, as you might see the Image, and not the Glass; which for beauty and strangeness were a fine proof, for then you shall see the Image like a Spirit in the Air. As for example, if there be a Cistern or Pool of Water, you shall place over against it a picture of the Devil, or what you will, so as you do not see the Water, then put a Looking glass in the Water: Now if you can see the Devils picture aside, not seeing the Water, it will look like a Devil indeed. They have an old tale in *Oxford*, That Fryer *Bacon* walked between two Steeples; which was thought to be done by Glasses, when he walked upon the Ground.

763.

Experiments
in Consort,
touching the
Impulsion and
Percussion.

A Weighty Body put into Motion, is more easily impelled then at first when it resteth. The cause is, partly because Motion doth discuss the Torpour of solid Bodies, which beside their Motion of Gravity, have in them a Natural Appetite not to move at all; and partly, because a Body that resteth doth get, by the resistance of the Body upon which it resteth, a stronger compression

compression of parts then it hath of it self, and therefore needeth more force to be put in motion. For if a weighty Body be pensile, and hang but by a thred, the percussio will make an impulsio very near as easily as if it were already in motion.

A Body over-great or over-small, will not be thrown so far as a Body of a middle size; so that (it seemeth) there must be a commensuration or proportion between the Body moved, and the force, to make it move well. The cause is, because to the Impulsion there is requisite the force of the Body that moveth, and the resistance of the Body that is moved; and if the Body be too great, it yieldeth too little; and if it be too small, it resisteth too little.

It is common experience, that no weight will press or cut so strong being laid upon a Body, as falling or stricken from above. It may be the Air hath some part in furthering the percussio: But the chief cause I take to be, for that the parts of the Body moved, have by impulsio, or by the motion of gravity continued, a compression in them as well downwards, as they have when they are thrown or shot through the Air forwards. I conceive also, that the quick loose of that motion preventeth the resistance of the Body below; and priority of the force (always) is of great efficacy, as appeareth in infinite instances.

764.

765.

Tickling is most in the Soles of the Feet, and under the Arm-holes, and on the Sides. The cause is, the thinness of the Skin in those parts, joynd with the rareness of being touched there; for all Tickling is a light motion of the Spirits, which the thinness of the Skin, and suddenness and rareness of touch do farther: For we see a Feather or a Rush drawn along the Lip or Cheek, doth tickle; whereas a thing more obtuse, or a touch more hard, doth not. And for suddenness, we see no man can tickle himself: We see also, that the Palm of the Hand, though it hath as thin a Skin as the other parts mentioned, yet is not ticklish, because it is accustomed to be touched. Tickling also causeth Laughier. The cause may be the emission of the Spirits, and so of the Breath, by a flight from Titillation; for upon Tickling, we see there is ever a starting or shrinking away of the part to avoid it; and we see also, that if you tickle the Nostrils with a Feather or Straw, it procureth Sneezing, which is a sudden emission of the Spirits, that do likewise expel the moisture. And Tickling is ever painful, and not well endured.

766.

Experiment Solitary, touching Titillation.

It is strange, that the River of Nilus overflowing, as it doth the Countrey of Egypt, there should be nevertheless little or no Rain in that Countrey. The cause must be, either in the Nature of the Water, or in the Nature of the Air, or of both. In the Water, it may be ascribed either unto the long race of the Water; for swift-running Waters vapor not so much as standing Waters, or else to the concoction of the Water; for Waters well concocted, vapor not so much as Waters raw, no more then Waters upon the fire do vapor so much, after some time of boyling, as at the first. And it is true, that the Water of Nilus is sweeter then other Waters in taste; and it is excellent good for the Stone, and Hypochondriacal Melancholy, which sheweth it is lenifying; and it runneth through a Countrey of a hot Climate, and flat, without shade either of Woods or Hills, whereby the Sun must needs have great power to concoct it. As for the Air (from whence I conceive this want of Showers cometh chiefly) the cause must be,

767.

Experiment Solitary, touching the Scarcity of Rain in Egypt.

for that the Air is of it self thin and thirity, and as soon as ever it getteth any moisture from the Water, it imbibeth, and dissipateth it in the whole Body of the Air, and suffereth it not to remain in Vapor, whereby it might breed Rain.

768.
Experiment
Solitary,
touching
Clarification.

IT hath been touched in the Title of Perlocations, (namely, such as are inwards) that the Whites of Eggs and Milk do clarify; and it is certain, that in *Egypt* they prepare and clarify the Water of *Nile*, by putting it into great Jars of Stone, and stirring it about with a few stamped Almonds; where-with they also besmear the Mouth of the Vessel; and so draw it off, after it hath rested sometime. It were good to try this Clarifying with Almonds in new Beer or Must, to hasten and perfect the Clarifying.

769.
Experiment
Solitary,
touching
Plants with-
out Leaves.

THERE be scarce to be found any Vegetables that have Branches and no Leaves, except you allow Coral for one. But there is also in the Desarts of *S. Macario* in *Egypt*, a Plant which is long, Leafless, brown of colour, and branched like Coral, save that it closeth at the top. This being set in Water within House, spreadeth and displayeth strangely; and the people thereabout have a superstitious belief, that in the Labor of Women it helpeth to the easie Deliverance.

770.
Experiment
Solitary,
touching the
Materials of
Glas.

THE *Crystalline Venice-Glass* is reported to be a mixture, in equal portions, of Stones brought from *Pavia*, by the River *Ticinum*, and the Ashes of a Weed called by the *Arabs*, *Kall*, which is gathered in a Desert between *Alexandria* and *Rosetta*; and is by the *Egyptians* used first for Fuel, and then they crush the Ashes into lumps like a Stone, and so sell them to the *Venetians* for their Glas-works.

771.
Experiment
Solitary,
touching
Prohibition of
Putrefaction,
and the long
Conservation
of Bodies.

IT is strange, and well to be noted, how long Carcasses have continued uncorrupt, and in their former Dimensions; as appeareth in the *Mummies* of *Egypt*, having lasted, as is conceived (some of them) three thousand years. It is true, they finde means to draw forth the Brains, and to take forth the Entrails, which are the parts aptest to corrupt. But that is nothing to the wonder; for we see what a soft and corruptible substance the Flesh of all the other parts of the Body is. But it should seem, that according to our observation and axiom, in our hundredth Experiments, *Putrefaction*, which we conceive to be so natural a Period of Bodies, is but an accident; and that Matter maketh not that haste to Corruption that is conceived; and therefore Bodies in shining Amber, in Quick-silver, in Balms, (whereof we now speak) in Wax, in Honey, in Gums, and (it may be) in Conservatories of Snow, &c. are preserved very long. It need not go for repetition, if we resume again that which we said in the afore-said Experiments concerning *Annihilation*, namely, That if you provide against three causes of *Putrefaction*, Bodies will not corrupt. The first is, that the Air be excluded; for that undermineth the Body, and conspireth with the Spirit of the Body to dissolve it. The second is, that the Body adjacent and ambient be not Commaterial, but meerly Heterogeneous towards the Body that is to be preserved; for if nothing can be received by the one, nothing can issue from the other; such are Quick-silver and White Amber to Herbs and Flies, and such Bodies. The third is, that the Body to be preserved be not of that gross that it may corrupt within it self, although no part of it issue into the Body adjacent; and therefore it must be rather thin
and

and small then of Bulk. There is a fourth Remedy also, which is, That if the Body to be preserved, be of bulk, as a Corps is, then the Body that incloseth it must have a virtue to draw forth and dry the moisture of the inward Body; for else the Putrefaction will play within, though nothing issue forth. I remember *Livy* doth relate, that there were found at a time two Coffins of Lead in a Tomb, whereof the one contained the Body of King *Numa*, it being some Four hundred years after his death, and the other, his Books of Sacred Rites and Ceremonies, and the Discipline of the Pontiffs: And that in the Coffin that had the Body, there was nothing (at all) to be seen but a little light Cinders about the sides; but in the Coffin that had the Books, they were found as fresh as if they had been but newly written, being written in Parchment, and covered over with Watch-candles of Wax three or four fold. By this it seemeth, that the *Romans* in *Numa's* time were not so good Embalmers as the *Egyptians* were; which was the cause that the Body was utterly consumed. But I finde in *Plutarch* and others, that when *Augustus Caesar* visited the Sepulchre of *Alexander* the Great in *Alexandria*, he found the Body to keep his Dimension; but wihal, that notwithstanding all the Embalming (which no doubt was of the best) the Body was so tender, as *Caesar* touching but the Nose of it, defaced it. Which maketh me finde it very strange, that the *Egyptian Mummies* should be reported to be as hard as Stone-pitch: For I finde no difference but one, which indeed may be very material; namely, that the ancient *Egyptian Mummies* were shrowded in a number of folds of Linnen; besmeared with Gums, in manner of Sear-cloth; which it doth not appear, was practised upon the Body of *Alexander*.

Near the Castle of *Catie*, and by the Wells *Affan*, in the Land of *Idumaea*, a great part of the way, you would think the Sea were near hand, though it be a good distance of: And it is nothing, but the shining of the *Nitre* upon the *Sea-sands*; such abundance of *Nitre* the Shores there do put forth.

The *Dead-Sea*, which vomiteth up *Bitumen*, is of that Crassitude, as Living Bodies, bound hand and foot, and cast into it, have been borne up and not sunk: Which sheweth, that all sinking into Water, is but an overweight of the Body put into the Water, in respect of the Water; so that you may make Water so strong and heavy of *Quick-silver*, (perhaps) or the like, as may bear up Iron; of which I see no use, but *Imposture*. We see also, that all Metals, except Gold, for the same reason swim upon *Quick silver*:

It is reported, that at the Foot of a Hill near the *Mare mortuum*, there is a Black Stone (whereof *Pilgrims* make Fires) which burneth like a Coal and diminisheth not, but onely waxeth brighter and whiter. That it should do so, is not strange; for we see Iron red hot burneth and consumeth not. But the strangeness is, that it should continue any time so; for Iron, as soon as it is out of the Fire, deadeth straight-ways. Certainly, it were a thing of great use and profit, if you could finde out Fuel that would burn hot, and yet last long: Neither am I altogether incredulous, but there may be such Candles as (they say) are made of *Salamanders Wool*, being a kinde of Mineral which whiteneth also in the burning, and consumeth not. The Question is this, Flame must be made of somewhat; and commonly it

772.
Experiment Solitary, touching the Abundance of Nitre in certain Sea-shores.

773.
Experiment Solitary, touching Bodies that are borne up by Water.

774.
Experiment Solitary, touching Fuel that consumeth little or nothing.

is made of some tangible Body which hath weight; but it is not impossible, perhaps, that it should be made of Spirit or Vapor in a Body, (which Spirit or Vapor hath no weight) such as is the matter of *Ignis fatuus*. But then you will say, that that Vapor also can last but a short time. To that it may be answered, That by the help of Oyl and Wax, and other Candle-stuff, the flame may continue, and the wick not burnt.

775.
Experiment
Solitary,
Oeconomical
touching cheap
Fewel.

Sea-coal last longer then Char-coal; and Char-coal of Roots, being coaled into great pieces, last longer then ordinary Char-coal. Turf, and Peas, and Cow-sheards are cheap Fewels, and last long. Small-coal or Char-coal poured upon Char-coal make them last longer. Sedge is a cheap Fewel to Brew or Bake with, the rather, because it is good for nothing else. Tryal would be made of some mixture of Sea-coal with Earth, or Chalk; for if that mixture be, as the Sea-coal-men use it privily, to make the Bulk of the Coal greater, it is deceit; but if it be used purposely, and be made known, it is saving.

776.
Experiment
Solitary,
touching the
Gathering of
Wind for
Freshness.

IT is at this day in use in *Gaza*, to couch Pot-sherds or Vessels of Earth in their Walls, to gather the Wind from the top, and to pass it down in Spouts into Rooms. It is a device for freshness in great Heats. And it is said, there are some Rooms in *Italy* and *Spain* for freshness, and gathering the Winds and Air in the Heats of Summer; but they be but Pennings of the Winds, and enlarging them again, and making them reverberate, and go round in Circles, rather then this device of Spouts in the Wall.

777.
Experiment
Solitary,
touching the
Tryals of
Airs.

THere would be used much diligence in the choice of some Bodies and Places (as it were) for the tasting of Air, to discover the wholesomeness or unwholesomeness as well of Seasons, as of the Seats of Dwellings. It is certain, that there be some Houses wherein Confitures and Pies, will gather Mould more then in others; and I am perswaded, that a piece of raw Flesh or Fish, will sooner corrupt in some Airs then in others. They be noble Experiments that can make this discovery; for they serve for a Natural Divination of Seasons, better then the Astronomers can by their Figures; and again, they teach men where to chuse their dwelling for their better health.

778.
Experiment
Solitary,
touching
Increasing of
Milk in
Milk-Beasts.

THere is a kinde of Stone about *Bethlehem* which they grinde to powder, and put into Water, whereof Cattel drink, which maketh them give more Milk. Surely, there would be some better Tryals made of Mixtures of Water in Ponds for Cattel, to make them more Milch, or to fatten them, or to keep them from *Murrain*. It may be, Chalk and Nitre are of the best.

779.
Experiment
Solitary,
touching
Sand of the
Nature of
Glas.

IT is reported, that in the Valley near the Mountain *Carmel* in *Judea*, there is a Sand, which of all other, hath most affinity with Glas, intomuch, as other Minerals laid in it, turn to a glassie substance without the fire; and again, Glas put into it, turneth into the Mother-sand. The thing is very strange, if it be true; and it is likeliest to be caused by some natural Furnace of Heat in the Earth, and yet they do not speak of any Eruption of Flames. It were good to try in Glas works, whether the crude Materials of Glas mingled with Glas, already made and remoulten, do not facilitate the making of Glas with less heat.

IN the Sea, upon the *South-West* of *Sicily*, much *Corál* is found. It is a *Sub-marine* Plant, it hath no leaves, it brancheth onely when it is under *Water*; it is soft, and green of colour; but being brought into the *Air*, it becometh hard, and shining red; as we see. It is said also to have a white *Berry*, but we finde it not brought over with the *Corál*: Belike it is cast away as nothing worth. *Idquire better of it, for the discovery of the Nature of the Plant.*

780.
Experiment
Solitary,
touching the
Growth of
Corál.

THe *Manna* of *Calabria* is the best, and in most plenty. They gather it from the *Leaf* of the *Mulberry-tree*; but not of such *Mulberry-trees* as grow in the *Valleys*: And *Manna* falleth upon the *Leaves* by night, as other *Dews* do. It should seem, that before those *Dews* come upon *Trees* in the *Valleys*, they dissipate and cannot hold out. It should seem also, the *Mulberry-leaf* it self hath some coagulating virtue, which inspissateth the *Dew*, for that it is not found upon other *Trees*: And we see by the *Silk worms*, which feedeth upon that *Leaf*, what a dainty smooth *Juice* it hath; and the *Leaves* also (especially of the *Black Mulberry*) are somewhat bristly, which may help to preserve the *Dew*. Certainly, it were not amiss to observe a little better the *Dews* that fall upon *Trees* or *Herbs* growing on *Mountains*; for it may be, many *Dews* fall that spend before they come to the *Valleys*. And I suppose, that he that would gather the best *May Dew* for *Medicine*, should gather it from the *Hills*.

781.
Experiment
Solitary,
touching the
Gathering of
Manna.

IT is said, they have a manner to prepare their *Greek Wines*, to keep them from *Fuming* and *Inebriating*, by adding some *Sulphur* or *Allum*; whereof the one is *Unctuous*, and the other is *Astringent*. And certain it is, that those two *Natures* do repress the *Fumes*. This *Experiment* would be transferred unto other *Wine* and *Strong-Beer*, by putting in some like *Substances* while they work; which may make them both to *Fume* less, and to *inflame* less.

782.
Experiment
Solitary,
touching the
Correcting of
Wine.

IT is conceived by some, (not improbably) that the reason why *Wild-fires* (whereof the principal ingredient is *Bitumen*) do not quench with *Water*, is, for that the first concretion of *Bitumen*, is a mixture of a fiery and watry substance; so is not *Sulphur*. This appeareth, for that in the place near *Puteoli*, which they call the *Court of Vulcan*, you shall hear under the *Earth* a horrible thundring of *Fire* and *Water* conflicting together; and there break forth also *Spouts* of boiling *Water*. Now that place yieldeth great quantities of *Bitumen*; whereas *Etna*, and *Vesuvius*, and the like, which consist upon *Sulphur*, shoot forth *Smoak*, and *Ashes*, and *Pumice*; but no *Water*. It is reported also, that *Bitumen* mingled with *Lime*, and put under *Water*, will make, as it were, an artificial *Rock*, the substance becometh so hard.

783.
Experiment
Solitary,
touching the
Materials of
Wildfire.

THere is a *Cement* compounded of *Flower*, *Whites of Eggs*, and *Stone* powdered, that becometh hard as *Marble*, wherewith *Piscina Mirabilis*, near *Cuma*, is said to have the *Walls* plaistered. And it is certain, and tried, that the *Powder* of *Load-stone* and *Flint*, by the addition of *Whites of Eggs* and *Gum-dragon*, made into *Paste*, will in a few days harden to the hardness of a *Stone*.

784.
Experiment
Solitary,
touching
Plaster grow-
ing as hard as
Marble.

785.

Experiment
Solitary,
touching
Judgment of
the Cure in
some Ulcers
and Hurts.

IT hath been noted by the *Ancients*, that in full or impure Bodies, Ulcers or Hurts in the Legs are hard to cure, and in the Head more easie. The cause is, for that Ulcers or Hurts in the Legs require Desiccation, which by the defluxion of Humors to the lower parts is hindered, whereas Hurts and Ulcers in the Head require it not; but, contrariwise, Dryness maketh them more apt to Consolidate. And in Modern observation, the like difference hath been found between French-men and English men; whereof the ones Constitution is more dry, and the others more moist: And therefore a Hurt of the Head is harder to cure in a French-man, and of the Leg in an English-man.

786.

Experiment
Solitary,
touching the
Healthfulness
or Unhealth-
fulness of the
Southern
Wind.

IT hath been noted by the *Ancients*, that *Southern Winds* blowing much without Rain, do cause a *Fevorous Disposition* of the *Year*; but with Rain, not. The cause is, for that *Southern Winds* do of themselves qualifie the Air to be apt to cause *Fevers*; but when Showers are joyned, they do refrigerate in part, and check the soultry Heat of the *Southern Wind*. Therefore this holdeth not in the *Sea-coasts*, because the vapor of the *Sea* without Showers doth refresh.

787.

Experiment
Solitary,
touching
Wounds.

IT hath been noted by the *Ancients*, that Wounds which are made with *Brafs*, heal more easily then Wounds made with *Iron*. The cause is, for that *Brafs* hath in it self a *Sanative* virtue, and so in the very instant helpeth somewhat; but *Iron* is *Corrosive*, and not *Sanative*. And therefore it were good that the Instruments which are used by *Chirurgions* about Wounds were rather of *Brafs* then *Iron*.

788.

Experiment
Solitary,
touching
Mortification
by Cold.

IN the cold Countreys, when Mens Noses and Ears are mortified, and (as it were) Gangrened with cold, if they come to a *Fire*, they rot off presently. The cause is, for that the few Spirits that remain in those parts are suddenly drawn forth, and so *Putrefaction* is made compleat. But *Snow* put upon them helpeth, for that it preserveth those Spirits that remain till they can revive; and besides, *Snow* hath in it a secret warmth; as the *Monk* proved out of the Text, *Qui dat Nivem sicut Lanam, Gelu sicut Cineres spargit*; whereby he did infer, that *Snow* did warm like *Wool*, and *Frost* did fret like *Ashes*. *Warm Water* also doth good, because by little and little it openeth the pores, without any sudden working upon the Spirits. This *Experiment* may be transferred unto the cure of *Gangrenes*, either coming of themselves, or induced by too much applying of *Opiates*; wherein you must beware of dry Heat, and resort to things that are *Refrigerant*, with an inward warmth and virtue of cherishing.

789.

Experiment
Solitary,
touching
Weights.

WEigh *Iron* and *Aqua-fortis* severally, then dissolve the *Iron* in the *Aqua-fortis*, and weigh the *Dissolution*; and you shall finde it to bear as good weight as the *Bodies* did severally, notwithstanding a good deal of waste by a thick vapor that issueth during the working; which sheweth, that the opening of a *Body* doth increase the weight. This was tryed once or twice, but I know not whether there were any *Error* in the *Tryal*.

790.

Experiment
Solitary,
touching the
Supernation of
Bodies.

TAKE of *Aqua-fortis* two Ounces, of *Quick-silver* two Drachms, (for that charge the *Aqua-fortis* will bear) the *Dissolution* will not bear a *Flint* as big as a *Nutmeg*; yet (no doubt) the increasing of the weight of
Water

Water will increate his power of bearing; as we see Broyn, when it is salt enough, will bear an Egg. And I remember well a Payfitian, that used to give some Mineral Baths for the Gout &c. And the Body when it was put into the Bath, could not get down so easily as in ordinary Water. But it seemeth, the weight of the Quicksilver, more then the weight of a Stone, doth not compense the weight of a Stone, more then the weight of the *Aqua-fortis*.

LET there be a Body of unequal weight, (as of Wood and Lead, or Bone and Lead;) if you throw it from you with the light end forward, it will turn, and the weightier end will recover to be forwards, unless the Body be over-long. The cause is, for that the more Dense Body hath a more violent pressure of the parts from the first impulsion; which is the cause (though heretofore not found out, as hath been often said) of all Violent Motions: And when the hinder part moveth swifter (for that it less endureth pressure of parts) then the forward part can make way for it, it must needs be that the Body turn over; for (turned) it can more easily draw forward the lighter part. *Galileus* noteth it well, That if an open Trough, wherein Water is, be driven faster then the Water can follow, the Water gathereth upon an heap towards the hinder end, where the motion began; which he supposeth (holding confidently the motion of the Earth) to be the cause of the Ebbing and Flowing of the Ocean, because the Earth over-runnerth the Water. Which Theory though it be false, yet the first *Experiment* is true; as for the inequality of the pressure of parts, it appeareth manifestly in this, That if you take a body of Stone or Iron, and another of Wood, of the same magnitude and shape, and throw them with equal force, you cannot possibly throw the Wood so far as the Stone or Iron.

IT is certain (as it hath been formerly in part touched) that Water may be the *Medium* of Sounds. If you dash a Stone against a Stone in the bottom of the Water, it makes a Sound; so a long Pole struck upon Gravel, in the bottom of the Water, maketh a Sound. Nay, if you should think that the Sound cometh up by the Pole, and not by the Water, you shall finde that an Anchor let down by a Rope maketh a Sound; and yet the Rope is no solid Body, whereby the Sound can ascend.

ALL objects of the Senses which are very offensive, do cause the Spirits to retire; and upon their flight, the parts are (in some degree) destitute, and so there is induced in them a trepidation and horror. For Sounds, we see, that the grating of a Saw, or any very harsh noise, will set the Teeth on edge, and make all the Body shiver. For Tastes, we see, that in the taking of a Potion, or Pills, the Head and the Neck shake. For odious smells, the like effect followeth, which is less perceived, because there is a remedy at hand, by stopping of the Nose. But in Horses, that can use no such help, we see the smell of a Carrion, especially of a dead Horse, maketh them flee away, and take on almost, as if they were mad. For Feeling, if you come out of the Sun suddenly into a shade, there followeth a chilness or shivering in all the Body. And even in Sight, which hath (in effect) no odious object, coming into sudden darkness, induceth an offer to shiver.

THERE is in the City of *Ticinum* in *Italy*, a Church that hath Windows only from above; it is in Length an hundred Feet, in Breadth twenty Feet, and in Height near fifty, having a Door in the midst. It reporteth, the

on of Echoes.

the voice twelve or thirteentimes. If you stand by the close end-wall over against the Door, the Echo fadeth and dieth by little and little, as the Echo at *Pont-Charenton* doth, and the voice soundeth as if it came from above the Door; and if you stand at the lower end, or on either side of the Door, the Echo holdeth; but if you stand in the Door, or in the midst just over against the Door, not. Note, that all Echoes sound better against old Walls then new, because they are more dry and hollow.

795.
Experiment
Solitary,
touching the
force of Imagi-
nation, Imitating
that of
the Sense.

THose effects which are wrought by the percussion of the Sense, and by things in Fact, are produced likewise in some degree by the Imagination: Therefore if a man see another eat sour or acide things, which set the Teeth on edge, this object tainteth the Imagination; so that he that seeth the thing done by another, hath his own Teeth also set on edge. So if a man see another turn swiftly and long, or if he look upon Wheels that turn, himself waxeth Turn-sick. So if a man be upon a high place, without Rails, or good hold, except he be used to it, he is ready to fall; for imagining a fall, it putteth his spirits into the very action of a fall. So many upon the seeing of others Bleed, or Strangled, or Tortured, themselves are ready to faint, as if they bled, or were in strife.

796.
Experiment
Solitary,
touching
Preservation
of Bodies.

TAKE a *Stock-Gilliflower*, and tie it gently upon a stick, and put them both into a Stoop-glass full of Quick-silver, so that the Flower be covered; then lay a little weight upon the top of the Glass, that may keep the stick down; and look upon them after four or five days, and you shall finde the Flower fresh, and the Stalk harder and less flexible then it was. If you compare it with another Flower, gathered at the same time, it will be the more manifest. This sheweth, that *Bodies* do preserve excellently in *Quick-silver*; and not preserve onely, but by the coldness of the *Quick-silver*, indurate. For the freshness of the Flower may be merely Conservation, (which is the more to be observed, because the *Quick-silver* presseth the Flower) but the stiffness of the Stalk cannot be without Induration from the cold (as it seemeth) of the *Quick silver*.

797.
Experiment
Solitary,
touching the
Growth or
Multiplying
of Metals.

IT is reported by some of the *Ancients*, That in *Cyprus* there is a kinde of Iron, that being cut into little pieces, and put into the ground, if it be well watered, will encrease into greater pieces. This is certain, and known of old, that Lead will multiply and encrease; as hath been seen in old *Statues* of Stone, which have been put in *Cellars*, the Feet of them being bound with *Leaden bands*; where (after a time) there appeared, that the Lead did swell, insomuch, as it hanged upon the Stone like Warts.

798.
Experiment
Solitary,
touching the
Drowning of
the more Base
Metal, in the
more Precious.

ICALL that drowning of Metals, when the baser Metal is so incorporate with the more rich, as it can by no means be separated again; which is a kinde of *Version*, though false; as if *Silver* should be inseparably incorporated with *Gold*, or *Copper* and *Lead* with *Silver*. The *Anciens Electrum* had in it a fifth of *Silver* to the *Gold*, and made a Compound Metal, as fit for most uses as *Gold*, and more resplendent, and more qualified in some other properties; but then that was easily separated. This to do privily, or to make the Compound pass for the rich Metal simple, is an adulteration or counterfeiting; but if it be done avowedly and without disguising, it may be a great saving of the richer Metal. I remember to have heard of a man skilful in Metals, that a fifteenth part of *Silver* incorporate with

Gold

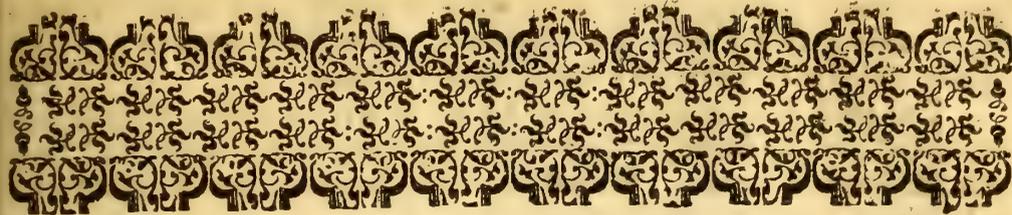

Gold is the onely Substance which hath nothing in it Volatile, and yet melteth without much difficulty. The Melting sheweth, that it is not jejune or scarce in Spirit. So that the fixing of it is not want of Spirit to flie out, but the equal spreading of the Tangible parts, and the close coacervation of them; whereby they have the lels appetite, and no means (at all) to issue forth. It were good therefore to try whether Glafs Re-molten, do lose any weight; for the parts in Glafs are evenly spred, but they are not so close as in Gold; as we see by the easie admission of Light, Heat, and Cold, and by the smalness of the weight. There be other Bodies fixed, which have little or no Spirit, so as there is nothing to flie out; as we see in the Stuff, whereof Coppels are made, which they put into Furnaces, upon which Fire worketh not. So that there are three causes of Fixation; the *Even-spreading* both of the *Spirits* and *Tangible parts*; the *Closeness* of the *Tangible parts*; and the *Jejuneness* or *Extream Comminution* of *Spirits*: Of which three, the two first may be joyned with a *Nature Liquefiable*, the last not.

799.
Experiment
Solitary,
touching
Fixation of
Bodies.

IT is a profound *Contemplation in Nature*, to consider of the Emptiness (as we may call it) or Insatisfaction of several Bodies, and of their appetite to take in others. Air taketh in Lights, and Sounds, and Smells, and Vapors: And it is most manifest, that it doth it with a kinde of Thirst, as not satisfied with his own former Consistence; for else it would never receive them in so suddenly and easily. *Water* and all *Liquors* do hastily receive dry and more Terrestrial Bodies proportionable; and *Dry Bodies*, on the other side, drink in *Waters* and *Liquors*: So that (as it was well said by one of the *Ancients*, of *Earthy* and *Watry* Substances) one is a *Glue* to another. *Parchments*, *Skins*, *Cloth*, &c. drink in *Liquors*; though themselves be entire Bodies, and not comminuted, as *Sand* and *Ashes*, nor apparently porous. *Metals* themselves do receive in readily *Strong-waters*, and *Strong-waters* likewise do readily pierce into *Metals* and *Stones*; and that *Strong-water* will touch upon *Gold*, that will not touch upon *Silver*, and *è converso*. And *Gold*, which seemeth by the weight to be the closest and most solid Body, doth greedily drink in *Quick-silver*. And it seemeth, that this Reception of other Bodies is not violent; for it is (many times) reciprocal, and, as it were, with consent. Of the cause of this, and to what Axiom it may be referred, consider attentively; for as for the pretty assertion, That *Matter* is like a *Common Strumpet* that desireth all *Forms*, it is but a *Wandering Notion*. Onely *Flame* doth not content it self to take in any other Body; but either to overcome, and turn another Body into it self, as by victory, or it self to die and go out.

NATURAL HISTORY

Century IX.

It is certain, That all *Bodies* whatsoever, though they have no Sense, yet they have Perception: For when one *Body* is applied to another, there is a kinde of Election, to embrace that which is agreeable, and to exclude or expel that which is ingrate: And whether the *Body* be alterant or altered, evermore a Perception precedeth Operation; for else all *Bodies* would be alike one to another. And sometimes this Perception in some kinde of *Bodies* is far more subtil then the Sense; so that the Sense is but a dull thing in comparison of it. We see a *Weather-glass* will finde the least difference of the Weather in Heat or Cold, when Men finde it not. And this Perception also is sometimes at distance, as well as upon the touch; as when the *Load-stone* draweth Iron, or Flame fireth *Naphtha* of *Babylon* a great distance off. It is therefore a subject of a very *Noble Enquiry*, to enquire of the more subtil Perceptions; for it is another Key to open *Nature*, as well as the *Sense*, and sometimes better: And besides, it is a principal means of *Natural Divination*; for that which in these Perceptions appeareth early, in the great effects cometh long after. It is true also, that it serveth to discover that which is hid, as well as to foretel that which is to come, as it is in many subtil Tryals: As to try whether *Seeds* be old or new, the *Sense* cannot inform; but if you boil them in Water, the new *Seeds* will sprout sooner. And so of Water, the taste will not discover the best Water; but the speedy consuming of it, and many other means which we have heretofore set down, will discover it. So in all *Physiognomy*, the *Lineaments* of the *Body* will discover those *Natural Inclinations* of the *Minde*, which *Disimulation* will conceal, or *Discipline* will suppress. We shall therefore now handle onely those two Perceptions which pertain to *Natural Divination* and *Discovery*, leaving the handling of

Experiments
in Consort;
touching
Perception in
Bodies Insens-
sible, sending

Divination by
Subtil Tryals.

Perception in other things to be disposed elsewhere. Now it is true, that *Divination* is attained by other means ; as if you know the causes, if you know the *Concomitants*, you may judge of the effect to follow ; and the like may be said of *Discovery*. But we tie our selves here to that *Divination* and *Discovery* chiefly, which is caused by an early or subtil *Perception*.

The aptness or propension of Air or Water to corrupt or putrefie, (no doubt) is to be found before it break forth into manifest effects of *Diseases*, *Blasting*, or the like. We will therefore set down some *Prognosticks* of *Pestilential* and unwholsome years.

801. The Wind blowing much from the South without Rain, and Worms in the Oak-Apple, have been spoken of before. Also the plenty of Frogs, Grasshoppers, Flies, and the like Creatures bred of Putrefaction, doth portend *Pestilential* years.

802. Great and early Heats in the Spring, (and namely in *May*) without Winds, portend the same. And generally so do years with little Wind or Thunder.

803. Great Droughts in Summer, lasting till towards the end of *August*, and some gentle showers upon them, and then some dry weather again, do portend a *Pestilent* Summer the year following : For about the end of *August*, all the sweetness of the Earth which goeth into *Plants* or *Trees* is exhaled ; (and much more if the *August* be dry) so that nothing then can breath forth of the Earth but a gross vapor, which is apt to corrupt the Air ; and that vapor by the first showers, if they be gentle, is released, and cometh forth abundantly. Therefore they that come abroad soon after those showers are commonly taken with sickness. And in *Africk* no Body will stir out of doors after the first showers. But if the first showers come vehemently, then they rather wash and fill the Earth, then give it leave to breath forth presently. But if dry weather come again, then it fixeth and continueth the corruption of the Air upon the first showers begun, and maketh it of ill influence even to the next Summer, except a very Frosty Winter discharge it, which seldom succeedeth such Droughts.

804. The lesser Infections of the *Small-Pox*, *Purple Feavers*, *Agues* in the Summer precedent, and hovering all Winter, do portend a great *Pestilence* in the Summer following : For Putrefaction doth not rise to its height at once.

805. It were good to lay a piece of raw Flesh or Fish in the open Air ; and if it putrefie quickly, it is a sign of a disposition in the Air to Putrefaction. And because you cannot be informed, whether the Putrefaction be quick or late, except you compare this Experiment with the like Experiment in another year ; it were not amiss in the same year, and at the same time, to lay one piece of Flesh or Fish in the open Air, and another of the same kinde and bigness within doors : For I judge, that if a general disposition be in the Air to putrefie, the Flesh or Fish will sooner putrefie abroad, where the Air hath more power then in the House, where it hath less, being many ways corrected. And this Experiment would be made about the end of *March* ; for that season is likeliest to discover what the Winter hath done, and what the Summer following will do upon the Air. And because the Air (no doubt) receiveth great tincture and infusion from the Earth, it were good to try that exposing of Flesh

or Fish both upon a Stake of Wood, some height above the Earth, and upon the flat of the Earth.

Take *May Dew*, and see whether it putrefie quickly, or no; for that likewise may disclose the quality of the Air, and vapor of the Earth, more or less corrupted.

A dry *March*, and a dry *May*, portend a wholesome Summer, if there be a showring *April* between; but otherwise it is a sign of a *Pestilential year*.

As the discovery of the disposition of the Air is good for the *Prognosticks* of wholesome and unwholesome years; so it is of much more use for the choice of **places** to dwell in; at the least for Lodges and Retiring-places for Health, (for Mansion-Houses respect provisions as well as health) wherein the *Experiments* above-mentioned may serve.

But for the choice of **Places or Seats**, it is good to make tryal, not onely of aptness of Air to corrupt, but also of the moisture and dryness of the Air, and the temper of it in heat or cold; for that may concern health diversly. We see that there be some Houses wherein *Sweet Meats* will relent, and *Baked Meats* will mould, more then in others; and *Wainscots* will also sweat more, so that they will almost run with **Water**: All which (no doubt) are caused chiefly by the moistness of the Air in those Seats. But because it is better to know it before a Man buildeth his House, then to finde it after, take the *Experiments* following.

Lay **Wool**, or a **Sponge**, or **Bread** in the place you would try, comparing it with some other places; and see whether it doth not moisten, and make the **Wool** or **Sponge**, &c. more ponderous then the other: And if it do, you may judge of that place, as situate in a gross and moist Air.

Because it is certain that in some places, either by the Nature of the Earth, or by the situation of Woods and Hills, the Air is more unequal then in others; and inequality of Air is ever an enemy to health: It were good to take two **Weather-Glasses**, matches in all things, and to set them for the same hours of one day in several places where no shade is nor enclosures, and to mark when you set them, how far the **Water** cometh; and to compare them when you come again, how the **Water** standeth then. And if you finde them unequal, you may be sure, that the place where the **Water** is lowest is in the warmer Air, and the other in the Colder. And the greater the inequality is of the ascent or descent of the **Water**, the greater is the inequality of the temper of the Air.

The *Predictions* likewise of cold and long **Winters**, and hot and dry **Summers**, are good to be known, as well for the discovery of the causes, as for divers Provisions. That of *Plenty of Haws*, and *Heps*, and *Bryar-Berries*, hath been spoken of before. If *Wainscots* or *Stone*, that have used to sweat, be more dry in the beginning of **Winter**, or the drops of the **Eavs** of Houses come more slowly down then they use, it portendeth a hard and frosty **Winter**. The cause is, for that it sheweth an inclination of the Air to dry **Weather**, which in **Winter** is ever joyned with **Frost**.

Generally a moist and a cool **Summer**, portendeth a hard **Winter**. The cause is, for that the vapors of the Earth are not dissipated in the **Summer** by the **Sun**; and so they rebound upon the **Winter**.

A hot and dry **Summer** and **Autumn**, and especially if the heat and drought extend far into *September*, portendeth an open beginning of **Winter**, and colds to succeed toward the latter part of the **Winter**, and the beginning of the **Spring**. For till then the former heat and drought bear the sway, and the vapors are not sufficiently multiplied.

806.

807.

808.

809.

810.

811.

812.

813.

814.

815. An open and warm Winter portendeth a hot and dry Summer: For the Vapors disperse into the Winter showers; whereas Cold and Frost keepeth them in, and transporteth them into the late Spring and Summer following.
816. *Birds* that use to change Countreys at certain Seasons, if they come earlier, do shew the temperature of Weather according to that Countrey whence they came: As the Winter-Birds, (namely, *Woodcocks, Feldefares &c.*) if they come earlier, and out of the Northern Countreys, with us shew cold Winters. And if it be in the same Countrey, then they shew a temperature of Season, like unto that Season in which they come; as, *Swallows, Bats, Cuckoes, &c.* that come towards Summer, if they come early, shew a hot Summer to follow.
817. The *Prognosticks* more immediate of Weather to follow soon after, are more certain then those of Seasons: The Resounding of the Sea upon the Shore, and the Murmur of Winds in the Woods, without apparent Wind, shew Wind to follow. For such Winds, breathing chiefly out of the Earth, are not at the first perceived, except they be pent by Water or Wood. And therefore a Murmur out of Caves likewise portendeth as much.
818. The Upper Regions of the Air, perceive the Collection of the matter of Tempest and Winds before the Air here below, And therefore the obscuring of the smaller Stars, is a sign of Tempests following. And of this kinde you shall finde a number of instances in our *Inquisition de Ventis*.
819. Great Mountains have a Perception of the disposition of the Air to Tempests sooner, then the Valleys or Plains below. And therefore they say in *Wales*, *When certain Hills have their Night-caps on, they mean mischief.* The cause is, for that Tempests which are for the most part bred above in the Middle Region, (as they call it) are soonest perceived to collect in the places next it.
820. The Air and Fire have subtil Perceptions of Wind rising before Men finde it. We see the trembling of a Candle will discover a Wind, that otherwise we do not feel; and the Flexious burning of Flames doth shew the Air beginneth to be unquiet; and so do Coals of fire, by casting off the ashes more then they use. The cause is, for that no Wind at the first, till it hath struck and driven the Air, is apparent to the Sense; but flame is easier to move then Air. And for the Ashes, it is no marvel though Wind unperceived shake them off; for we usually try which way the Wind bloweth, by casting up Grasse or Chaff, or such light things into the Air.
821. When Wind expireth from under the Sea, as it causeth some resoundings of the Water, (whereof we spake before) so it causeth some light motions of Bubbles, and white Circles of Froth. The cause is, for that the Wind cannot be perceived by the Sense, until there be an Eruption of a great quantity from under the Water, and so it getteth into a Body, whereas in the first putting up, it cometh in little portions.
822. We spake of the Ashes that Coals cast off, and of Grasse and Chaff carried by the Wind; so any light thing that moveth when we finde no Wind, sheweth a Wind at hand: As when Feathers or Down of Thistles flie to and fro in the Air.
- For *Prognosticks* of Weather from *Living Creatures*, it is to be noted, That Creatures that live in the open Air (*sub dio*) must needs have a quicker impression from the Air, then Men that live most within doors; and especially *Birds* who live in the Air freest and clearest, and are aptest by their voice to tell tales what they finde, and likewise by the motion of their flight to expresse the same.

Water-fowls (at *Sea-Gulls, Moor-Hens, &c.*) when they flock and flie together from the *Sea* towards the *Shores*; and contrariwise *Land Birds*, (as *Crows Swallows, &c.* when they flie from the *Land* to the *Water*s, and beat the *Water*s with their *Wings*, do foreshew *Rain* and *Wind*. The cause is, *Pleasure* that both kindes take in the moistness and density of the *Air*, and so desire to be in motion, and upon the *Wing*, whither-soever they would otherwise go: For it is no marvel that *Water-fowl* do joy most in that *Air* which is likest *Water*s; and *Land Birds* also (many of them) delight in *Bathing* and moist *Air*. For the same reason also, many *Birds* do prune their *Feathers*, and *Geete* do gagle, and *Crows* seem to call upon *Rain*. All which is but the comfort they seem to receive in the relieving of the *Air*.

823.

The *Heron* when she soareth high, (so as sometimes she is seen to pass over a *Cloud*) sheweth *Winds*: But *Kites* flying aloft, shew fair and dry weather. The cause may be, for that they both mount most into the *Air* of that temper wherein they delight. And the *Heron*, being a *Water-fowl*, taketh pleasure in the *Air* that is condensed; and besides, being but heavy of *Wing*, needeth the help of the grosser *Air*. But the *Kite* affecteth not so much the grossness of the *Air*, as the cold and freshness thereof; for being a *Bird of Prey*, and therefore hot, she delighteth in the fresh *Air*, and (many times) flieth against the *Wind*; as *Troats* and *Salmons* swim against the stream. And yet it is true also, that all *Birds* finde an ease in the depth of the *Air*, as *Swimmers* do in a deep *Water*. And therefore when they are also, they can uphold themselves with their *Wings* spread, scarce moving them.

824.

Fishes when they play towards the top of the *Water*, do commonly foretel *Rain*. The cause is, for that a *Fish* nating the dry, will not approach the *Air* till it groweth moist; and when it is dry will flie it, and swim lower.

825.

Beasts do take comfort (generally) in a moist *Air*, and it maketh them eat their *Meat* better; and therefore *Sheep* will get up berimes in the morning to feed against *Rain*; and *Cattle*, and *Deer*, and *Coneys* will feed hard before *Rain*; and a *Heifer* will put up his *Nose*, and snuff in the *Air* against *Rain*.

826.

The *Trifol* against *Rain*, swelleth in the *Stalk*, and so standeth more upright; for by wet, *Stalks* do erect, and *Leaves* bow down. There is a small *Red Flower* in the *Stubble-fields*, which *Countrey* people call the *Wincopipe*; which, if it open in the *Morning*, you may be sure of a fair day to follow.

827.

Even in *Measles, Aches, and Hurts, and Corns*, do engrieve either towards *Rain*, or towards *Frost*; for the one maketh the *Humors* more to abound, and the other maketh them sharper. So we see both extreame bring the *Gout*.

828.

Worms, Vermine, &c. do foreshew (likewise) *Rain*; for *Earth-worms* will come forth, and *Moles* will cast up more, and *Fleas* bite more against *Rain*.

829.

Solid Bodies likewise foreshew *Rain*: As *Stones* and *Wainscot* when they sweat, and *Boxes* and *Pegs of Wood* when they draw and wind hard; though the former be but from an outward cause, for that the *Stone* or *Wainscot* turneth and beateth back the *Air* against it self; but the latter is an inward swelling of the *Body* of the *Wood* it self.

830.

831.
Experiment
Solitary,
touching the
Nature of
Appetite in
the Stomack.

Appetite is moved chiefly by things that are cold and dry. The cause is, for that Cold is a kinde of indigence of Nature, and calleth upon supply, and so is Dryness: And therefore all four things (as *Vinegar*, *Juyce of Lemmons*, *Oyl of Virriol*, &c.) provoke Appetite. And the Disease which they call *Appetitus Caninus*, consisteth in the Matter of an Acide and Glassie Phlegm in the Mouth of the Stomack. Appetite is also moved by four things, for that four things induce a contraction in the *Nerves*, placed in the Mouth of the Stomack, which is a great cause of Appetite. As for the cause why *Onions*, and *Salt*, and *Pepper* in Baked Meats move Appetite, it is by Vellication of those *Nerve*s; for Motion whetteth. As for *Wormwood*, *Oliyes*, *Capers*, and others of that kinde, which participate of Bitterness, they move Appetite by Absterfion. So as there be four principal causes of Appetite; the Refrigeration of the Stomack joyned with some Dryness, Contraction, Vellication, and Absterfion; besides Hunger, which is an emptiness; and yet overfasting doth (many times) cause the Appetite to cease; for that want of Meat maketh the Stomack draw Humors, and such Humors as are light and Cholerick, which quench Appetite most.

832.
Experiment
Solitary,
touching
Sweetness of
Odor from the
Rainbow.

IT hath been observed by the *Ancients*, that where a *Rainbow* seemeth to hang over, or to touch, there breatheth forth a sweet smell. The cause is, for that this happeneth but in certain matters which have in themselves some Sweetness, which the gentle Dew of the *Rainbow* doth draw forth; and the like do soft Showers, for they also make the Ground sweet: But none are so delicate as the Dew of the *Rainbow* where it falleth. It may be also, that the Water itself hath some Sweetness; for the *Rainbow* consisteth of a Glomeration of small drops, which cannot possibly fall but from the Air that is very low, and therefore may hold the very Sweetness of the Herbs and Flowers as a Distilled Water: For Rain and other Dew that fall from high cannot preserve the smell, being dissipated in the drawing up; neither do we know, whether some Water itself may not have some degree of Sweetness. It is true, that we finde it sensibly in no Pool, River, nor Fountain; but good Earth newly turned up, hath a freshness and good sent; which Water, if it be not too equal, (for equal objects never move the Sense) may also have. Certain it is; that *Baysalt*, which is but a kinde of Water congealed, will sometimes smell like *Violets*.

833.
Experiment
Solitary,
touching
Sweet Smells.

TO sweet Smells, heat is requisite to concoct the Matter, and some Moisture to spread the Breath of them: For heat, we see that Woods and Spices are more odorate in the Hot Countreys, then in the Cold. For Moisture, we see that things too much dried lose their Sweetness; and Flowers growing smell better in a Morning or Evening, then at Noon. Some sweet smells are destroyed by approach to the Fire; as *Violets*, *Wall-flowers*, *Gilliflowers*, *Pinks*, and generally all Flowers that have cool and delicate Spirits. Some continue both on the fire, and from the fire, as *Rose-water*, &c. Some do scarce come forth, or at least not so pleasantly, as by means of the fire; as *Juniper*, *Sweet Gums*, &c. and all smells that are enclosed in a fast Body; but (generally) those smells are the most grateful where the degree of heat is small, or where the strength of the smell is allayed; for these things do rather woe the Sense, then satiate it. And therefore the smell of *Violets* and *Roses* exceedeth in sweetness that of Spices; and Gums, and the strongest sort of smells, are best in a west afar off.

IT is certain, that no smell issueth but with emission of some corporeal substance; not as it is in Light, and Colours, and Sounds: For we see plainly that smell doth spread nothing that distance that the other do. It is true, that some Woods of *Orenges*, and *Heaths of Rosemary*, will smell a great way into the Sea, perhaps twenty Miles; but what is that, since a peal of Ordnance will do as much, which moveth in a small compass, whereas those Woods and *Heaths* are of vast spaces? Besides, we see that smells do adhere to hard Bodies; as in perfuming of *Gloves*, &c. which sheweth them corporeal; and do last a great while, which Sounds and Light do not.

THe *Excrements* of most Creatures smell ill, chiefly to the same Creature that voideth them: For we see, besides that of Man, that Pigeons and Horses thrive best, if their Houses and Stables be kept sweet, and so of Cage-Birds; and the Cat burieth that which she voideth. And it holdeth chiefly in those Beasts which feed upon Flesh. *Dogs* (almost) onely of Beasts delight in fetide odors; which sheweth there is somewhat in their sense of smell differing from the smells of other Beasts. But the cause why *Excrements* smell ill is manifest, for that the Body it self rejecteth them, much more the Spirits: And we see, that those *Excrements* that are of the first digestion smell the worst, as the *Excrements* from the *Belly*; those that are from the second digestion, less ill, as *Urine*; and those that are from the third, yet less; for Sweat is not so bad as the other two, especially of some persons that are full of heat. Likewise most Putrefactions are of an odious smell, for they smell either fertile or mouldy. The cause may be, for that Putrefaction doth bring forth such a consistence as is most contrary to the consistence of the Body whilest it is sound, for it is a meer dissolution of that form. Besides, there is another reason, which is profound: And it is, That the objects that please any of the senses, have (all) some equality, and (as it were) order in their composition, but where those are wanting the object is ever ingrate. So mixture of many disagreeing colours is never unpleasant to the Eye: Mixture of discordant Sounds is unpleasant to the Ear; mixture or hotch-potch of many tastes is unpleasant to the taste; harshness and ruggedness of Bodies is unpleasant to the touch. Now it is certain, that all Putrefaction, being a dissolution of the first form, is a meer confusion, and unformed mixture of the part. Nevertheless, it is strange, and seemeth to cross the former observation, that some Putrefactions and Excrements do yield excellent Odors; as *Civet* and *Musk*, and, as some think, *Amber-greece*, for divers take it (though unprobably) to come from the Sperm of Fish; and the Mols we spake of from *Apple-trees* is little better than an Excretion. The reason may be, for that there passeth in the Excrements, and remaineth in the Putrefactions, some good spirits, especially where they proceed from Creatures that are very hot. But it may be also joynd with a further cause, which is more subtil; and it is, that the Senses love not to be over-pleas'd, but to have a commixture of somewhat that is in it self ingrate. Certainly, we see how Discords in Musick, falling upon Concorde, make the sweetest strains: And we see again what strange tastes delight the taste; as *Red-herrings*, *Caviare*, *Parmesan*, &c. And it may be the same holdeth in smells. For those kinde of smells that we have mentioned are all strong, and do pull and vellicate the Sense. And we finde also, that places where men Urine commonly have some smell of *Violets*. And Urine, if one hath eaten Nutmeg, hath some.

Fetide and
Fragrant O-
dors.

The slothful, general, and indefinite Contemplations and Notions of the *Elements*, and their Conjugations of the Influences of *Heaven*, of *Hot*, *Cold*, *Moisture*, *Drougth*, *Qualities Active*, *Passive* and the like, have swallowed up the true *Passages*, and *Processes*, and *Affects*, and *Consistencies of Matter*, and *Natural Bodies*. Therefore they are to be set aside, being but notional, and ill limited; and definite axioms are to be drawn out of measured instances, and so assent to be made to the more general axioms by Scale. And of these kinds of *Processes of Nature*, and *Characters of Matter*, we will now set down some instances.

836.
Experiment
Solitary,
touching the
Causes of *Putrefaction*.

All *Putrefactions* come chiefly from the inward *Spirits of the Body*, and partly also from the *Ambient Body*, be it *Air*, *Liquor*, or whatsoever else. And this last, by two means; either by Ingress of the substance of the *Ambient Body* into the *Body putrefied*, or by excitation and solicitation of the *Body putrefied*, and the parts thereof, by the *Body Ambient*. As for the received opinion, that *Putrefaction* is caused either by *Cold*, or *Peregrine* and *Preternatural Heat*, it is but nugation: For *Cold* in things inanimate, is the greatest enemy that is to *Putrefaction*, though it extinguisheth *Vivification*, which ever consisteth in *Spirits attenuate*, which the *Cold* doth congeal and coagulate. And as for the *Peregrine heat*, it is thus far true, That if the proportion of the *Adventive heat*, be greatly predominant to the *Natural heat*, and *Spirits of the Body*, it tendeth to dissolution, or notable alteration. But this is wrought by *Emission*, or *Suppression*, or *Suffocation* of the *Native Spirits*, and also by the *Disordination* and *Discomposure* of the *Tangible parts*, and other passages of *Nature*, and not by a conflict of *Heats*.

837.
Experiment
Solitary,
touching
Bodies unperfectly mixt.

In versions or main Alterations of *Bodies*, there is a *Medium* between the *Body*, as it is at first, and the *Body resulting*; which *Medium* is *Corpus imperfectè Mixtum*, and is transitory, and not durable; as *Mists*, *Smoaks*, *Vapors*, *Chylus* in the *Stomack*, *Living Creatures* in the first *Vivification*; and the middle action which produceth such *Imperfect Bodies*, is fitly called (by some of the *Ancients*) *Inquination* or *Inconcoction*, which is a kinde of *Putrefaction*; for the parts are in confusion till they settle one way or other.

838.
Experiment
Solitary,
touching
Concoction and Crudity.

The word *Concoction* or *Digestion*, is chiefly taken into use from *Living Creatures*, and their *Organs*, and from thence extended to *Liquors* and *Fruits*, &c. Therefore they speak of *Meat concocted*, *Urine* and *Excrements concocted*; and the *Four Digestions* (in the *Stomack*, in the *Liver*, in the *Arteries* and *Nerves*, and in the several parts of the *Body*) are likewise called *Concoctions*; and they are all made to be the works of *Heat*. All which notions are but ignorant catches of a few things, which are most obvious to *Mens observations*. The constantest notion of *Concoction* is, that it should signifie the degrees of alteration of one *Body* into another, from *Crudity* to *Perfect Concoction*, which is the ultimity of that action or process. And while the *Body* to be converted and altered is too strong for the efficient that should convert or alter it, (whereby it resisteth, and holdeth fast in some degree the first *Form* or *Consistence*) it is (all that while) *Crude* and *Inconcoct*, and the Process is to be called *Crudity* and *Inconcoction*. It is true, that *Concoction* is in great part the work of *Heat*; but not the work of *Heat* alone: For all things that further the *Conversion* or *Alteration* (as *Rest*, *Mixture* of a *Body* already concocted, &c.) are also means to *Concoction*. And there

there are of Concoction two Periods; the one Assimilation, or absolute Conversion and Subaction; the other Maturation: Whereof, the former is most conspicuous in the Bodies of *Living Creatures*, in which there is an *Absolute Conversion* and *Assimilation* of the *Nourishment* into the Body, and likewise in the Bodies of Plants; and again, in Metals, where there is a full Transmutation. The other (which is Maturation) is seen in Liquors and Fruits; wherein there is not desired, nor pretended, an utter Conversion, but only an Alteration to that Form which is most sought for Mans use; as in Clarifying of Drinks, Ripening of Fruits, &c. But note, that there be two kinds of *Absolute Conversions*. The one is, when a Body is converted into another Body which was before; as when Nourishment is turned into Flesh: That is it which we call *Assimilation*. The other is, when the *Conversion* is into a Body merely new, and which was not before; as if *Silver* should be turned to *Gold*, or *Iron* to *Copper*. And this *Conversion* is better called, by distinction sake, *Transmutation*.

There are also divers other great alterations of Matter and Bodies, besides those that tend to *Concoction* and *Maturation*; for whatsoever doth so alter a Body, as it returneth not again to that it was, may be called *Alteratio Major*: As when Meat is Boiled, or Roasted, or Fried, &c. or when Bread and Meat are Baked; or when Cheese is made of Curds, or Butter of Cream, or Coals of Wood, or Bricks of Earth; and a number of others. But to apply *Notions Philosophical* to *Plebeian Terms*; or to say, where the *Notions* cannot fitly be reconciled, that there wanteth a *Term* or *Nomenclature* for it, (as the *Ancients* used) they be but shifts of *Ignorance*: For *Knowledge* will be ever a Wandring and Indigested thing, if it be but a commixture of a few *Notions* that are at hand, and occur, and not excited from sufficient number of instances, and those well collated.

The *Consistencies* of *Bodies* are very divers; *Dense, Rare, Tangible, Pneumatical; Volatile, Fixed; Determinate, not Determinate; Hard, Soft; Cleaving, not Cleaving; Congelable, not Congelable; Liquefiable, not Liquefiable; Fragile, Tough; Flexible, Inflexible; Tractile, or to be drawn forth in length, Intractile; Porous, Solide; Equal and Smooth, Unequal; Venous and Fibrous, and with Grains, Entire, and divers others.* All which to refer to *Heat* and *Cold*, and *Moisture* and *Drought*, is a *Compendious* and *Inutile Speculation*. But of these see principally our *Abecedarium Natura*, and otherwise *sparsum* in this our *Sylva Sylvarum*. Nevertheless, in some good part, we shall handle divers of them now presently.

Liquefiable and not Liquefiable proceed from these causes. *Liquefaction* is ever caused by the Detention of the Spirits, which play within the Body, and open it. Therefore such Bodies as are more Turgid of Spirit, or that have their Spirits more streightly imprisoned, or again, that hold them better pleased and content, are *Liquefiable*: For these three *Dispositions of Bodies* do arrest the Emission of the Spirits. An example of the first two *Properties* is in Metals, and of the last in Grease, Pitch, Sulphur, Butter, Wax, &c. The Disposition not to Liquefie, proceedeth from the easie Emission of the Spirits, whereby the grosser parts contract; and therefore Bodies *jejun*e of Spirits, or which part with their Spirits more willingly, are not *Liquefiable*; as Wood, Clay, Freestone, &c. But yet even many of those Bodies that will not melt, or will hardly melt, will notwithstanding soften; as Iron in the Forge,

839.

Bodies Lique-
fiable, and not
Liquefiable.

Forge, and a Stick bathed in hot Ashes, which thereby becometh more Flexible. Moreover, there are some Bodies which do *Liquefe* or dissolve by Fire; as *Metals, Wax, &c.* and other Bodies which dissolve in Water, as *Salt, Sugar, &c.* The cause of the former proceedeth from the Dilatation of the Spirits by Heat: The cause of the latter proceedeth from the opening of the Tangible Parts, which desire to receive the Liquor. Again, there are some Bodies that dissolve with both; as *Gum, &c.* And those be such Bodies as on the one side have good store of Spirit, and on the other side have the Tangible parts indigent of Moisture; for the former helpeth to the dilating of the Spirits by the Fire, and the latter stimulateth the parts to receive the Liquor.

841.
Experiment
Solitary,
touching the
Bodies Fragile
and Tough.

OF Bodies some are Fragile, and some are Tough and not Fragile; and in the breaking, some Fragile Bodies break but where the force is, some shatter and flie in many picces. Of Fragility, the cause is an impotency to be extended; and therefore Stone is more Fragile then Metal, and so Fiçtile Earth is more Fragile then Crude Earth, and Dry Wood then Green. And the cause of this unaptness to Extension, is the small quantity of Spirits (for it is the Spirit that furthereth the Extension or Dilatation of Bodies;) and it is ever concomitant with Porosity, and with Driness in the Tangible parts. Contrariwise, Tough Bodies have more Spirits, and fewer Pores, and Moister Tangible parts: Therefore we see, that Parchment or Leather will stretch, Paper will not; Woollen-Cloth will tenter, Linnen scarcely.

842.
Experiment
Solitary,
touching the
Two kindes of
Pneumatics
in Bodies.

ALL solid Bodies consist of Parts of two severall Natures; *Pneumaticals*, and *Tangible*: And it is well to be noted, that the *Pneumatical Substance* is in some Bodies, the Native Spirit of the Body; and in some other, plain Air that is gotten in; as in Bodies desiccate, by Heat, or Age: For in them, when the Native Spirit goeth forth, and the Moisture with it, the Air with time getteth into the Pores. And those Bodies are ever the more Fragile; for the Native Spirit is more Yielding and Extensive (especially to follow the Parts) than Air. The Native Spirits also admit great diversity; as Hot, Cold, Active, Dull, &c. Whence proceed most of the Vertues, and Qualities (as we call them) of Bodies: But the Air intermixt, is without Vertues, and maketh things insipid, and without any extimulation.

843.
Experiment
Solitary,
touching
Concretion and
Dissolution of
Bodies.

THE Concretion of Bodies is (commonly) solved by the contrary; as Ice, which is congealed by Cold, is dissolved by Heat; Salt and Sugar, which are excoded by Heat, are dissolved by Cold and Moisture. The cause is, for that these operations are rather returns to their former Nature; than alterations; so that the contrary cureth. As for Oyl, it doth neither easily congeal with Cold, nor thicken with Heat. The cause of both Effects, though they be produced by contrary efficient, seemeth to be the same; and that is, because the Spirit of the Oyl, by either means, exaleth little: For the Cold keepeth it in, and the Heat (except it be vehement) doth not call it forth. As for Cold, though it take hold of the Tangible Parts, yet as to the Spirits, it doth rather make them swell, than congeal them: As when Ice is congealed in a Cup, the Ice will swell instead of contracting, and sometimes rift.

OF Bodies, some (we see) are hard, and some soft: The hardness is caused (chiefly) by the Jejuneness of the Spirits; and their imparity with the Tangible parts: Both which, if they be in a greater degree, maketh them not onely hard, but fragile, and less enduring of pressure; as *Steel, Stone, Glass, Dry Wood, &c.* Softness cometh (contrariwise) by the greater quantity of Spirits, (which ever helpeth to induce yielding and cession;) and by the more equal spreading of the Tangible parts, which thereby are more sliding, and following; as in *Gold, Lead, Wax, &c.* But note, that soft Bodies (as we use the word) are of two kindes; the one, that easily giveth place to another Body, but altereth not Bulk by rising in other places; and therefore we see that *Wax*, if you put any thing into it, doth not rise in Bulk, but onely giveth place: For you may not think, that in Printing of *Wax*, the *Wax* riseth up at all; but onely the depressed part giveth place, and the other remaineth as it was. The other that altereth Bulk in the Cession, as *Water*, or other Liquors, if you put a *Stone*, or any thing into them, they give place (indeed) easily, but then they rise all over; which is a false Cession, for it is in place, and not in Body.

ALl Bodies *Ductile*, and *Tensile*, (as Metals) that will be drawn into Wires; *Wool*, and *Tow* that will be drawn into Yarn or Thred; have in them the Appetite of Not discontinuing, strong; which maketh them follow the force that pulleth them out; and yet so, as not discontinue or forsake their own Body. Viscous Bodies (likewise) as *Pitch, Wax, Birdlime, Cheese* toasted, will draw forth and roap. But the difference between Bodies fibrous, and Bodies viscous, is plain: For all *Wooll*, and *Tow*, and *Cotton*, and *Silk* (especially raw *Silk*) have, besides their desire of continuance, in regard of the tenuity of their Thred, a greediness of Moisture, and by Moisture to joyn and incorporate with other Thred, especially, if there be a little *Wreathing*, as appeareth by the twisting of Thred, and the practice of *Twirling* about of Spindles. And we see also, that *Gold* and *Silver* Thred cannot be made without *Twisting*.

THe differences of impressible, and not impressible; figurable, and not figurable; mouldable, and not mouldable; scissible, and not scissible; and many other Passions of Matter; are Plebeian Notions, applied unto the Instruments and Uses which Men ordinarily practise; but they are all but the effects of some of these causes following, which we will enumerate without applying them, because that would be too long. The first is the Cession; or not Cession of Bodies, into a smaller space, or room, keeping the outward Bulk, and not flying up. The second is, the stronger or weaker Appetite, in Bodies, to continuity, and to flie discontinuity. The third is, the disposition of Bodies, to contract, or not contract; and again, to extend, or not extend. The fourth is, the small quantity, or great quantity of the Pneumatical in Bodies. The fifth is, the nature of the Pneumatical, whether it be Native Spirit of the Body, or common Air. The sixth is, the Nature of the Native Spirits in the Body, whether they be Active, and Eager; or Dull, and Gentle. The seventh is, the emission or detension of the Spirits in Bodies. The eighth is, the dilatation or contraction of the Spirits in Bodies, while they are detained. The ninth is, the collocation of the Spirits in Bodies, vvhether the collocation be equal or unequal; and again, vvhether the Spirits be coacervate or diffused. The tenth is, the density or rarity of the Tangible parts.

the eleventh is the Equality or Inequality of the Tangible parts ; the twelfth is the Digestion or Crudity of the Tangible parts ; the thirteenth is the Nature of the Matter, whether Sulphureous, or Mercurial, or Watry, or Oily, Dry, and Terrestrial, or Moist and Liquid ; which Natures of Sulphureous and Mercurial, seem to be Natures Radical and Principal ; the fourteenth is the placing of the Tangible parts, in Length or Transverse (as it is in the Warp, and the Woof of Textiles;) more inward or more outward, &c. The fifteenth is the Porosity or Imporosity betwixt the Tangible parts, and the greatness or smallness of the Pores ; the sixteenth is the Collocation and posture of the Pores. There may be more causes, but these do occur for the present.

847.
Experiment
Solitary,
touching
Induration by
Sympathy.

TAKE Lead and melt it, and in the midst of it, when it beginneth to congeal, make a little dint or hole, and put Quick-silver wrapped in a piece of Linnen into that hole. and the Quick-silver will fix, and run no more, and endure the Hammer. This is a noble instance of Induration, by consent of one Body with another, and Motion of Excitation to imitate ; for to ascribe it onely to the vapor of the Lead, is less probable. *Quære*, whether the fixing may be in such a degree, as it will be figured like other Metals ? For if so, you may make Works of it for some purposes, so they come not near the Fire.

848.
Experiment
Solitary,
touching
Honey and
Sugar.

SUGAR hath put down the use of Honey, insomuch, as we have lost those Observations and preparations of Honey, which the *Ancients* had, when it was more in price. First, it seemeth, that there was in old time Tree-honey, as well as Bee-honey, which was the Year or Blood issuing from the Tree ; insomuch, as one of the *Ancients* relateth, that in *Tribesond*, there was Honey issuing from the Box-trees, which made Men mad. Again, in ancient time, there was a kinde of Honey, which either of the own Nature, or by Art, would grow as hard as Sugar, and was not so luscious as ours ; they had also a Wine of Honey, which they made thus. They crushed the Honey into a great quantity of Water, and then strained the liquor, after they boiled it in a Copper to the half ; then they poured it into Earthen Vessels for a small time, and after turned it into Vessels of Wood, and kept it for many years. They have also, at this day in *Russia*, and those Northern Countreys, *Mead Simple*, which (well made and seasoned) is a good wholesome Drink, and very clear. They use also in *Wales*, a Compound Drink of *Mead*, with Herbs and Spices. But mean while it were good, in recompence of that we have lost in Honey, there were brought in use a *Sugar-Mead* (for so we may call it) though without any mixture at all of Honey ; and to brew it, and keep it itale, as they use *Mead* ; for certainly, though it would not be so absterfiv, and opening, and solutive a Drink as *Mead* ; yet it will be more grateful to the Stomack, and more lenitive, and fit to be used in sharp Diseases : For we see, that the use of Sugar in Beer and Ale, hath good effects in such cases.

849.
Experiment
Solitary,
touching the
Finer sort of
Base Metals.

IT is reported by the *Ancients*, that there is a kinde of *Steel*, in some places, which would polish almost as white and bright as Silver. And that there was in *India* a kinde of *Brass*, which (being polished) could scarce be discerned from Gold. This was in the Natural *Ure*, but I am doubtful, whether Men have sufficiently refined Metals, which we count Base : As, whether Iron, Brass, and Tin, be refined to the height ? But when they
come

come to such a fineness, as serveth the ordinary use; they try no further.

THere have been found certain *Cements* under *Earth*, that are very soft, and yet taken forth into the Sun, harden as hard as *Marble*: There are also ordinary *Quarries* in *Sommerfet-shire*, which in the *Quarry* cut soft to any bigness, and in the *Building* prove firm, and hard.

850.
Experiment
Solitary,
touching
Cements and
Quarries.

Living *Creatures* (generally) do change their *Hair* with *Age*, turning to be *Gray* and *White*; as is seen in *Men*, though some earlier, some later; in *Horses*, that are *Dappled* and turn *White*; in *Old Squirrels*, that turn *Grissly*, and many others. So do some *Birds*; as *Cygnets* from *Gray* turn *White*; *Hawks* from *Brown* turn more *White*: And some *Birds* there be, that upon their *Moulting*, do turn *Colour*; as *Robin-Redbreasts*, after their *Moulting* grow to be *Red* again by degrees; so do *Gold-Finches* upon the *Head*. The cause is, for that *Moisture* doth (chiefly) colour *Hair*, and *Feathers*; and *Dryness* turneth them *Gray* and *White*; now *Hair* in *Age* waxeth *Dryer*, so do *Feathers*. As for *Feathers*, after *Moulting*, they are young *Feathers*, and so all one as the *Feathers* of young *Birds*. So the *Beard* is younger than the *Hair* of the *Head*, and doth (for the most part) wax *hoary* later. Out of this ground, a *Man* may devise the *Means* of altering the colour of *Birds*, and the *Retardation* of *Hoary-Hairs*. But of this see the *Fifth Experiment*.

851.
Experiment
Solitary,
touching the
Altering of
the Colour of
Hairs and
Feathers.

THe difference between *Male* and *Female*, in some *Creatures*, is not to be discerned, otherwise than in the parts of *Generation*; as in *Horses* and *Mares*, *Dogs* and *Bitches*, *Doves* he and she, and others. But some differ in magnitude, and that diversly: For in most the *Male* is the greater, as in *Man*, *Pheasants*, *Peacocks*, *Turkies*, and the like; and in some few, as in *Hawks*, the *Female*. Some differ in the *Hair* and *Feathers*, both in the quantity, *crispation*, and colours of them; as *He-Lions* are *Hirsuite*, and have great *Mains*; the *She's* are smooth like *Cats*. *Bulls* are more *crisp* upon the *Forehead* than *Cows*; the *Peacock*, and *Pheasant-cock*, and *Goldfinch-cock*, have glorious and fine colours; the *Hens* have not. Generally, the he's in *Birds* have the fairest *Feathers*. Some differ in divers features; as *Bucks* have *Horns*, *Does* none; *Rams* have more wreathed *Horns* than *Evvys*; *Cocks* have great *Combs* and *Spurs*, *Hens* little or none; *Boars* have great *Fangs*, *Sovvs* much less; the *Turkey-cock* hath great and swelling *Gills*, the *Hen* hath less; *Men* have generally deeper and stronger voices than *Women*. Some differ in faculty, as the *Cock* amongst *Singing Birds*, are the best singers. The chief cause of all these (no doubt) is, for that the *Males* have more strength of heat than the *Females*; which appeareth manifestly in this, that all young *Creatures* *Males* are like *Females*, and so are *Eunuchs*, and *Gelt* *Creatures* of all kindes, liker *Females*. Now heat causeth greatness of growth, generally, where there is moisture enough to work upon: But if there be found in any *Creature* (which is seen rarely) an over-great heat in proportion to the moisture, in them the *Female* is the greater; as in *Havvs* and *Sparrovvs*. And if the heat be ballanced with the moisture, then there is no difference to be seen between *Male* and *Female*; as in the instances of *Horses* and *Dogs*. We see also, that the *Horns* of *Oxen* and *Covvs*, for the most part, are larger than the *Bulls*, which is caused by abundance of moisture, which in the *Horns* of the *Bull* faileth. Again, Heat causeth *Pilosity*, and *Crispation*; and so likewise *Beards* in *Men*. It also expelleth

852.
Experiment
Solitary,
touching the
Differences of
Living Crea-
tures, Male
and Female.

finer moisture, which want of heat cannot expel; and that is the cause of the beauty and variety of Feathers: Again, Heat doth put forth many Excrescences, and much solid matter, which want of Heat cannot do. And this is the cause of Horns, and of the greatness of them; and of the greatness of the Combs, and Spurs of Cocks, Gills of Turkey-Cocks, and Fangs of Boars. Heat also dilateth the Pipes and Organs which causeth the deepness of the Voice. Again, Heat refineth the Spirits, and that causeth the Cock singing Bird to excel the Hen.

853.
Experiment
Solitary,
touching the
Comparative
Magnitude of
Living Crea-
tures.

THERE be Fishes greater than any Beasts; as the *Whale* is far greater than the *Elephant*. And Beasts are (generally) greater than Birds. For Fishes, the cause may be, that because they live not in the Air, they have not their moisture drawn, and soaked by the Air, and Sun-Beams. Also they rest always, in a manner, and are supported by the Water; whereas Motion and Labor do consume. As for the greatness of Beasts, more than of Birds, it is caused, for that Beasts stay longer time in the Womb than Birds, and there nourish, and grow; whereas in Birds, after the Egg laid, there is no further growth, or nourishment from the Female; for the sitting doth vivifie, and not nourish.

854.
Experiment
Solitary,
touching
Exoffiation of
Fruits.

WE have partly touched before the Means of producing Fruits, without Coars, or Stones. And this we add further, that the cause must be abundance of moisture; for that the Coar, and Stone, are made of a dry Sap: And we see, that it is possible to make a Tree put forth onely in Blossom without Fruit; as in *Cherries* with double Flowers, much more in Fruit without Stones, or Coars. It is reported, that a Cions of an Apple, grafted upon a Colewort-stalk, sendeth forth a great Apple without a Coar. It is not unlikely, that if the inward Pith of a Tree were taken out, so that the Juyce came onely by the Bark, it would work the effect. For it hath been observed, that in Pollards, if the Water get in on the top, and they become hollow, they put forth the more. We add also, that it is delivered for certain by some, that if the Cions be grafted, the small ends downwards, it will make Fruit have little or no Coars, and Stones.

855.
Experiment
Solitary,
touching the
Melioration of
Tobacco.

Tobacco is a thing of great price, if it be in request. For an Acre of it will be worth (as is affirmed) Two hundred pounds by the year towards charge. The charge of making the Ground, and otherwise, is great, but nothing to the profit. But the *English Tobacco* hath small credit, as being too dull and earthy: Nay, the *Virginian Tobacco*, though that be in a hotter climate, can get no credit for the same cause. So that a tryal to make *Tobacco* more Aromatical, and better concocted here in *England*, were a thing of great profit. Some have gone about to do it, by drenching the *English Tobacco*, in a Decoction or Infusion of *Indian Tobacco*. But those are but sophistications and toys; for nothing that is once perfect, and hath run his race, can receive much amendment; you must ever resort to the beginnings of things for Melioration. The way of Maturation of *Tobacco* must (as in other Plants) be from the Heat, either of the Earth, or of the Sun. We see some leading of this in Musk-Melons, which are sown upon a hot Bed, dinged below, upon a Bank turned upon the South Sun, to give Heat by Reflection; laid upon Tiles, which increaseth the Heat; and covered with Straw, to keep them from Cold; they remove them also, which addeth some Life: And by these helps they become as good in *England*,

England, as in Italy, or Provence. These and the like means may be tried in Tobacco. Enquire also of the steeping of Roots, in some such Liquor, as may give them Vigor to put forth strong.

Heat of the Sun, for the Maturity of Fruits; yea, and the heat of Vivification of Living Creatures, are both represented and supplied by the heat of Fire; and likewise, the heats of the Sun, and life, are represented one by the other. Trees, set upon the Backs of Chimneys, do ripen Fruit sooner. Vines, that have been drawn in at the Window of a Kitchen, have sent forth Grapes, ripe a moneth (at least) before others. Stoves, at the Back of Walls, bring forth Oranges here with us. Eggs, as is reported by some, have been hatched in the warmth of an Oven. It is reported by the Ancients, that the *Estrich* layeth her Eggs under Sand, where the heat of the Sun discloseth them.

Barley in the Boiling swelleth not much; Wheat swelleth more, *Rize* extremely; insomuch, as a quarter of a Pint (unboiled) will arise to a Pint boiled. The cause (no doubt) is, for that the more close and compact the Body is, the more it will dilate. Now Barley is the most hollow, Wheat more solid than that, and *Rize* most solid of all. It may be also, that some Bodies have a kinde of Lentor, and more deperible nature than others; as we see it evident in colouration; for a small quantity of *Saffron*, will tinct more, than a very great quantity of *Bresil*, or *Wine*.

Fruit groweth sweet by Rowling or Pressing them gently with the Hand; as Rowling Pears, Damascins, &c. By Rotteness; as Medlars, Services, Sloes, Heps, &c. By Time; as Apples, Wardens, Pomegranates, &c. By certain special Maturations; as by laying them in Hay, Straw, &c. And by Fire; as in Roasting, Stewing, Baking, &c. The cause of the sweetness by Rowling, and Pressing is, Emollition, which they properly enduce; as in bearing of Stock-fish, Flesh, &c. By Rotteness is, for that the Spirits of the Fruit, by Putrefaction, gather heat, and thereby digest the harder part: For in all Putrefactions there is a degree of heat. By Time and Keeping is, because the Spirits of the Body, do ever feed upon the tangible parts, and attenuate them. By several Maturations is, by some degree of heat. And by Fire is, because it is the proper work of Heat to refine, and to incorporate; and all sourness consisteth in some grossness of the Body: And all incorporation doth make the mixture of the Body, more equal, in all the parts, which ever enduceth a milder taste.

Of Fleashes, some are edible; some, except it be in Famine, not. As those that are not edible, the cause is, for that they have (commonly) too much bitterness of taste; and therefore those Creatures, which are fierce and choleric, are not edible; as Lions, Wolves, Squirrels, Dogs, Foxes, Horses, &c. As for Kine, Sheep, Goats, Deer, Swine, Conneys, Hares, &c. We see they are milde, and fearful. Yet it is true, that Horses which are Beasts of courage, have been and are eaten by some Nations; as the *Scythians* were called *Hippophagi*; and the *Chineses* eat *Hors-flesh* at this day; and some Gluttons have used to have Colts-flesh baked. In Birds, such as are *Carnivora*, and Birds of Prey, are commonly no good Meat; but the reason is, rather the Choleric Nature of those Birds, than their Feeding upon Flesh; for *Puits*, *Gulls*, *Shovelers*, *Ducks*, do feed upon Flesh, and yet are

856

Experiment Solitary, touching Several Heats working the same Effects.

Experiment Solitary, touching Swelling and Dilatation in Boiling.

858.

Experiment Solitary, touching the Dulcoration of Fruits.

859.

Experiment Solitary, touching Flesh Edible, and not Edible.

good Meat. And we see, that those Birds which are of Prey, or feed upon Flesh, are good Meat, when they are very Young; as *Travks*, *Rooks*, out of the Nest, *Owls*. Mans flesh is not eaten. The Reasons are three.

First, Because Men in Humanity do abhor it.

Secondly, Because no Living Creature, that dieth of it self, is good to eat; and therefore the *Cannibals* (themselves) eat no Mans flesh, of those that die of themselves, but of such as are slain.

The third is, Because there must be generally) some disparity between the Nourishment, and the Body nourished; and they must not be overnear, or like: Yet we see, that in great weakneses and Consumptions, Men have been sustained with Womans Milk. And *Picinus* fondly (as I conceive) adviseth, for the Prolongation of Life, that a Vein be opened in the Arm of some wholesome young man, and the blood to be sucked. It is said, that Witches do greedily eat Mans flesh, which if it be true, besides a devillish Appetite in them, it is likely to proceed; for that Mans flesh may send up high and pleasing Vapors, which may stir the Imagination, and Witches felicity is chiefly in Imagination, as hath been said.

860.
Experiment
Solitary,
touching the
Salamander.

THere is an ancient received Tradition of the *Salamander*, that it liveth in the Fire, and hath force also to extinguish the fire. It must have two things, if it be true, to this operation. The one, a very close skin, whereby flame, which in the midst is not so hot, cannot enter: For we see, that if the Palm of the Hand be anointed thick with White of Eggs, and then *Aquavina* be poured upon it, and enflamed, yet one may endure the flame a pretty while. The other is some extream cold and quenching vertue, in the Body of that Creature which choaketh the fire. We see that Milk quencheth Wildfire better than VVater, because it entreteth better.

861.
Experiment
Solitary,
touching the
Contrary operations
of
Time, upon
Fruits and
Liquors.

Time doth change Fruit (as *Apples*, *Pears*, *Pomegranates*, &c.) from more sour to more sweet; but contrariwise, Liquors (even those that are of the Juyce of Fruit) from more sweet to more sour; as, *Wort*, *Must*, *New Verjuyce*, &c. The cause is, the Congregation of the Spirits together; for in both kindes, the Spirit is attenuated by Time; but in the first kinde, it is more diffused, and more mastered by the grosser parts, which the Spirits do but digest: But in Drinks the Spirits do reign, and finding less opposition of the parts, become themselves more strong, which causeth also more strength in the Liquor; such, as if the Spirits be of the hotter sort, the Liquor becometh apt to burn; but in time, it causeth likewise, when the higher Spirits are evaporated more sournes.

862.
Experiment
Solitary,
touching the
Blows and
Bruises.

IT hath been observed by the *Ancients*, that Plates of Metal, and especially of Brass, applied presently to a blow, will keep it down from swelling. The cause is Repercussion, without Humection, or entrance of any Body: For the Plate hath onely a virtual cold, which doth not search into the hurt; whereas all Plaisters and Oynments do enter. Surely, the cause that blows and bruises induce swellings is, for that the Spirits resorting to succor the part that laboreth, draw also the humors with them: For we see, that it is not the repulse, and the return of the humor in the part stricken that causeth it; for that Gouts, and Toothachs cause swelling, where there is no Percussion at all.

THe nature of the *Orris* Root, is almost singular, for there be few odoriferous Roots; and in those that are in any degree sweet, it is but the same sweetness with the Wood or Leaf: But the *Orris* is not sweet in the Leaf, neither is the Flower any thing so sweet as the Root. The Root seemeth to have a tender dainty heat, which when it cometh above ground to the Sun, and the Air, vanisheth: For it is a great Mollifier, and hath a smell like a Violet.

863.
Experiment Solitary, touching the *Orris* Root.

IT hath been observed by the *Ancients* that a great Vessel full, drawn into Bottles; and then the Liquor put again into the Vessel, will not fill the Vessel again, so full as it was, but that it may take in more Liquor; and that this holdeth more in Wine, than in Water. The cause may be trivial, namely, by the expence of the Liquor, in regard some may stick to the sides of the Bottles: But there may be a cause more subtil, which is, that the Liquor in the Vessel, is not so much compressed, as in the Bottle; because in the Vessel, the Liquor meeteth with Liquor chiefly; but in the Bottles, a small quantity of Liquor meeteth with the sides of the Bottles, which compress it so, that it doth not open again.

864
Experiment Solitary, touching the Compression of Liquors.

Water being contiguous with Air, cooleth it, but moisteneth it not, except it Vapor. The cause is, for that Heat and Cold have a Virtual Transition, without Communication of substance, but moisture not; and to all madefaction there is required an imbibition: But where the Bodies are of such several Levity, and Gravity, as they mingle not, they can follow no imbibition. And therefore, Oyl likewise lieth at the top of the Water, without commixture: And a drop of Water running swiftly over a Straw or smooth Body, wetteth not.

865.
Experiment Solitary, touching the Working of Water upon Air contiguous.

Starlight Nights, yea, and bright Moonshine Nights, are colder than Cloudy Nights. The cause is, the driness and Fineness of the Air, which thereby becometh more piercing and sharp; and therefore great Continents are colder than Islands. And as for the Moon, though it self inclineth the Air to moisture, yet when it shineth bright, it argueth the Air is dry. Also close Air is warmer than open Air, which (it may be) is, for that the true cause of cold, is an expiration from the Globe of the Earth, which in open places is stronger. And again, Air it self, if it be not altered by that expiration, is not without some secret degree of heat; as it is not likewise without some secret degree of Light: For otherwise Cats, and Owls, could not see in the Night; but that Air hath a little Light, proportionable to the Visual Spirits of those Creatures.

866.
Experiment Solitary, touching the Nature of Air.

THe Eyes do move one and the same way; for when one Eye moveth to the Nostril, the other moveth from the Nostril. The cause is Motion of Consent which in the Spirits and Parts Spiritual, is strong. But yet use will induce the contrary; for some can squint when they will. And the common Tradition is, that if Children be set upon a Table with a Candle behinde them, both Eyes will move outwards, as affecting to see the Light, and so induce Squinting.

867.
Experiments in Consort, touching the Eyes and Sights.

We see more exquisitely with one Eye shut, than with both open. The cause is, for that the Spirits Visual unite themselves more, and so become stronger.

868.

stronger. For you may see, by looking in a Glass, that when you shut one Eye, the Pupil of the other Eye, that is open, dilateth.

869.

The Eyes, if the sight meet not in one Angle, see things double. The cause is, for that seeing two things, and seeing one thing twice, worke h the same effect: And therefore a little Pellet, held between two Fingers, laid a cross, seemeth double.

870.

Pore-blind Men, see best in the dimmer light; and likewise have their sight stronger near hand, than those that are not Poreblind, and can read and write smaller Letters. The cause is, for that the Spirits Visual, in those that are Poreblind, are thinner and rarer, than in others; and therefore the greater light disperseth them. For the same cause they need contracting; but being contracted, are more strong than the Visual Spirits of ordinary eyes are; as when we see thorow a Level, the sight is the stronger: And so is it, when you gather the Eye-lids somewhat close: And it is commonly seen in those that are Poreblind, that they do much gather the eye-lids together. But old Men, when they would see to read, put the Paper somewhat a far off. The cause is, for that old Mens Spirits Visual, contrary to those of Pore-blind Men unite not, but when the object is at some good distance from their Eyes.

871.

Men see better when their Eyes are over-against the Sun or a Candle, if they put their Hand a little before their Eye. The Reason is, for that the Glaring of the Sun, or the Candle, doth weaken the Eye; whereas the Light circumfused is enough for the Perception. For we see, that an over-light maketh the Eyes dazel, insomuch as perpetual looking against the Sun, would cause Blindness. Again, if Men come out of a great light, into a dark room; and contrariwise, if they come out of a dark room into a light room, they seem to have a Mist before their Eyes, and see worse than they shall do after they have staid a little while, either in the light, or in the dark. The cause is, for that the Spirits Visual, are upon a sudden change disturbed, and put out of order; and till they be recollected, do not perform their Function well. For when they are much dilated by light, they cannot contract suddenly; and when they are much contracted by darknes, they cannot dilate suddenly. And excess of both these, (that is, of the Dilatation, and Contraction of the Spirits Visual) if it be long, destroyeth the Eye. For as long looking against the Sun, or Fire, hurteth the Eye by Dilatation, so curious painting in small Volumes, and reading of small Letters, do hurt the Eye by contraction.

872.

It hath been observed, that in Anger the Eyes wax red; and in Blushing, not the Eyes, but the Ears, and the parts behind them. The cause is, for that in Anger, the Spirits ascend and wax eager; which is most easily seen in the Eyes, because they are translucent, though withal it maketh both the Cheeks, and the Gills red; but in Blushing, it is true, the Spirits ascend likewise to succor, both the Eyes and the Face, which are the parts that labor: But when they are repulsed by the Eyes, for that the Eyes, in shame do put back the Spirits that ascend to them, as unwilling to look abroad: For no Man, in that passion, doth look strongly, but dejectedly, and that repulsion from the Eyes, diverteth the Spirits and heat more to the Ears, and the parts by them.

873.

The objects of the Sight, may cause a great pleasure and delight in the Spirits, but no pain or great offence; except it be by Memory, as hath been said. The Glimpses and Beams of Diamonds that strike the Eye, *Indian Feathers*, that have glorious colours, the coming into a fair Garden, the coming

into

into a fair Room richly furnished; a beautiful person, and the like, do delight and exhilarate the Spirits much. The reason, why it holdeth not in the offence is, for that the Sight is most spiritual of the Senses; whereby it hath no object gross enough to offend it. But the cause (chiefly) is, for that there be no active objects to offend the Eye. For Harmonical Sounds; and Discordant Sounds, are both Active and Positive; so are sweet smells, and stinks; so are bitter, and sweets, in tastes; so are over-hot, and over-cold, in touch; but blackness, and darkness, are indeed but privatives; and therefore have little or no Activity. Somewhat they do contristate, but very little.

Water of the Sea, or otherwise, looketh blacker when it is moved, and whiter when it resteth. The cause is, for that by means of the Motion, the Beams of Light pass not straight, and therefore must be darkned; whereas when it resteth, the Beams do pass straight. Besides, splendor hath a degree of whiteness, especially, if there be a little repercussion; for a Looking-Glass with the Steel behind, looketh whiter than Glass simple. This Experiment deserveth to be driven further, in trying by what means Motion may hinder Sight.

Shell-fish have been by some of the Ancients, compared and fortified with the Insecta; but I see no reason why they should, for they have Male, and Female, as other Fish have; neither are they bred of Putrefaction, especially such as do move. Nevertheless it is certain, that Oysters; and Cockles, and Mussels, which move not, have not discriminate Sex. *Quære*, in what time, and how they are bred? It seemeth, that Shells of Oysters are bred where none were before; and it is tryed, that the great Horse-Muscle, with the fine shell, that breedeth in Ponds, hath bred within thirty years: But then, which is strange, it hath been tryed, that they do not onely gape and shut as the Oysters do, but remove from one place to another.

The Senses are alike strong, both on the right side, and on the left; but the Limbs on the right side are stronger. The cause may be, for that the Brain, which is the Instrument of Sense, is alike on both sides; but Motion, and habilities of moving, are somewhat holpen from the Liver, which lieth on the right side. It may be also, for that the Senses are put in exercise, indifferently on both sides from the time of our Birth; but the Limbs are used most on the right side, whereby custom helpeth: For we see, that some are left-handed, which are such as have used the left-hand most.

Friccions make the parts more fleshy, and full: As we see both in Men, and in the Currying of Horses, &c. The cause is, for that they draw greater quantity of Spirits and Blood to the parts; and again, because they draw the Aliment more forcibly from within; and again, because they relax the Pores, and so make better passage for the Spirits, Blood, and Aliment: Lastly, because they dissipate, and digest any Inutile, or Excrementitious moisture, which lieth in the Flesh; all which help Assimilation. *Friccions* also do, more fill and impinguate the Body, than Exercise. The cause is, for that in *Friccions*, the inward parts are at rest; which in exercise are beaten (many times) too much: And for the same reason (as we have noted heretofore) Gallislaves are fat and fleshy, because they stir the Limbs more, and the inward parts less.

Experiment Solitary, touching Frictions.

878.
Experiment
Solitary,
touching
*Globes ap-
pearing Flat
at distance.*

ALl *Globes* a far off, appear flat. The cause is, for that distance, being a secondary object of sight, is not otherwise discerned, than by more or less light; which disparity, when it cannot be discerned, all seemeth one: As it is (generally) in objects not distinctly discerned; for so Letters, if they be so far off, as they cannot be discerned, shew but as duskish Paper; and all Engravings and Embossings (a far off) appear plain.

879.
Experiment
Solitary,
touching
Shadows.

THe uttermost parts of *Shadows*, seem ever to tremble. The cause is, for that the little Moats which we see in the Sun, do ever stir, though there be no Wind; and therefore those moving, in the meeting of the Light and the Shadow, from the Light to the Shadow, and from the Shadow to the Light, do shew the shadow to move, because the *Medium* moveth.

880.
Experiment
Solitary,
touching the
*Rolling and
Breaking of
the Seas.*

Shallow and *Narrow Seas*, break more than deep and large. The cause is; for that the Impulsion being the same in both; where there is a greater quantity of Water, and likewise space enough, there the Water rouleth, and moveth, both more slowly, and with a sloper rise and fall: But where there is less Water, and less space, and the Water dasheth more against the bottom; there it moveth more swiftly, and more in Precipice: For in the breaking of the Waves, there is ever a Precipice.

881.
Experiment
Solitary,
touching the
*Dulcoration of
Salt water.*

IT hath been observed by the *Ancients*, that *Salt-water* boiled, or boiled and cooled again, is more potable, than of itself raw; and yet the taste of *Salt*, in Distillations by *Fire*, riseth not: For the Distilled Water will be fresh. The cause may be, for that the Salt part of the Water, doth partly rise into a kinde of Scum on the top, and partly goeth into a Sediment in the bottom; and so is rather a separation, than an evaporation. But it is too gross to rise into a vapor; and so is a bitter taste likewise: For simple distilled Waters of *Wormwood*, and the like, are not bitter.

882.
Experiment
Solitary,
touching the
*Return of
Saltness in
Pits upon the
Seashore.*

IT hath been set down before, that *Pits* upon the *Sea-shores* turn into fresh Water, by Percolation of the Salt through the Sand: But it is further noted, by some of the *Ancients*, that in some places of *Africk*, after a time, the Water in such Pits will become brackish again. The cause is, for that after a time, the very Sands, thorow which the *Salt-Water* passeth, become Salt; and so the Strainer it self is tinged with Salt. The remedy therefore is to dig still new Pits, when the old wax brackish; as if you would change your Strainer.

883.
Experiment
Solitary,
touching
*Attraction by
Similitude of
Substance.*

IT hath been observed by the *Ancients*, that *Salt-water* will dissolve Salt put into it, in less time, than Fresh Water will dissolve it. The cause may be, for that the Salt in the precedent Water, doth by similitude of Substance, draw the Salt new put in, unto it; whereby it diffuseth in the Liquor more speedily. This is a noble *Experiment*, if it be true; for it sheweth means of more quick and easie Infusions, and it is likewise a good instance of Attraction by Similitude of Substance. Try it with Sugar put into Water, formerly sugred, and into other Water unsugred.

884.
Experiment
Solitary,
touching
Attraction.

PUt *Sugar* into *Wine*, part of it above, part under the *Wine*; and you shall finde (that which may seem strange) that the *Sugar* above the *Wine*, will soften and dissolve sooner than that within the *Wine*. The cause is, for that the

the Wine entreth that part of the Sugar which is under the Wine, by simple Infusion or Spreading; but that part above the Wine is likewise forced by Sucking: For all Spongy Bodies expel the Air, and draw in Liquor, if it be contiguous; as we see it also in Sponges, put part above the Water. It is worthy the inquiry, to see how you may make more accurate Infusions, by help of Attraction.

Water in Wells is warmer in Winter than in Summer; and so Air in Caves. The cause is, for that in the higher parts, under the Earth, there is a degree of some heat (as appeareth in sulphureous Veins, &c.) which shut close in (as in Winter) is the more; but if it perspire (as it doth in Summer) it is the less.

IT is reported, that amongst the *Leucadians*, in ancient time, upon a superstition, they did use to precipitate a Man from a high Cliff into the Sea; tying about him with strings, at some distance, many great Fowls; and fixing unto his Body divers Feathers spread, to break the fall. Certainly many Birds of good Wing (as *Kites*, and the like) would bear up a good weight as they flie; and spreading of Feathers thin and close, and in great breadth, will likewise bear up a great weight, being even laid without tilting upon the sides. The further extension of this Experiment for Flying, may be thought upon.

There is in some places (namely, in *Cephalonia*) a little Shrub, which they call *Holy Oak*, or *Dwarf Oak*. Upon the Leaves whereof there riseth a Tumor, like a Blister; which they gather, and rub out of it, a certain red dust, that converteth (after a while) into Worms, which they kill with Wine, (as is reported) when they begin to quicken: With this Dust they Die Scarlet.

IN *Zant*, it is very ordinary, to make Men impotent, to accompany with their Wives: The like is practised in *Gascony*, where it is called *Nover l'Eguillete*. It is practised alvways upon the Wedding day. And in *Zant*, the Mothers themselves do it by vway of prevention, because thereby they hinder other Charms, and can undo their ovvn. It is a thing the *Civil Law* taketh knowledge of, and therefore is of no light regard.

IT is a common Experiment, but the cause is mistaken. Take a Pot. (or better a Glas, because therein you may see the Motion) and set a Candle lighted in the Bottom of a Bason of Water; and turn the Mouth of the Pot or Glas over the Candle, and it vvill make the Water rise. They ascribe it to the dravving of heat, & which is not true: For it appeareth plainly to be but a Motion of *Nexe*. vvhich they call *Ne detur vacuum*, and it proceedeth thus; The Flame of the Candle as soon, as it is covered, being suffocated by the close Air, lesseneth by little and little: During vvhich time, there is some little ascent of Water, but not much; for the Flame occupying less and less room, as it lesseneth, the Water succeedeth. But upon the instant of the Candles going out, there is a sudden rise of a great deal of Water; for that that the Body of the Flame filleth no more place, and so the Air and Water succeed. It vvorketh the same effect, if instead of Water, you put Flouwer, or Sand, into the Bason: Which sheweth, that it is not the Flames dravving the Liquor, as Nourishment, as it is supposed; for all Bodies are alike

alike unto it, as it is ever in motion of *Nexe*; inſomuch, as I have ſeen the Glaſs, being held by the hand, hath liſted up the Baſon, and all: The motion of *Nexe* did ſo claſp the bottom of the Baſon. That *Experiment*, when the Baſon was liſted up, was made with Oyl, and not with Water. Nevertheleſs this is true, that at the very firſt ſetting of the Mouth of the Glaſs, upon the bottom of the Baſon, it draweth up the Water a little, and then ſtandeth at a ſtay, almoſt till the Candles going out, as was ſaid. This may ſhew ſome Attraction at firſt; but of this we will ſpeak more, when we handle Attractions by Heat.

Experiments
in Conſort,
touching the
Influences of
the Moon.

OF the Power of the *Celeſtial Bodies*, and what more ſecret influences they have, beſides the two manifeſt influences of Heat and Light, we ſhall ſpeak, when we handle *Experiments* touching the *Celeſtial Bodies*: Mean while, we will give ſome Directions for more certain Tryals of the Vertue and Influences of the Moon, which is our neareſt Neighbor.

The Influences of the Moon (moſt obſerved) are four; the drawing forth of Heat; the Inducing of Putrefaction; the increaſe of Moiſture; the exciting of the Motions of Spirits.

890.

For the drawing forth of Heat, we have formerly preſcribed to take Water warm, and to ſet part of it againſt the Moon-beams, and part of it with a Skreen between; and to ſee whether that which ſtandeth expoſed to the Beams will not cool ſooner. But becauſe this is but a ſmall interpoſition, (though in the Sun we ſee a ſmall ſhade doth much) it were good to try it when the Moon ſhineth, and when the Moon ſhineth not at all; and with Water warm in a Glaſs-bottle as well as in a Diſh, and with Cinders, and with Iron red-hot, &c.

891.

For the inducing of Putrefaction, it were good to try it with Fleſh or Fiſh expoſed to the Moon-beams, and again expoſed to the Air when the Moon ſhineth nor, for the liketime, to ſee whether will corrupt ſooner; and try it alſo with Capon, or ſome other fowl laid abroad, to ſee whether it will mortifie and become tender ſooner. Try it alſo with dead Flies or dead Worms, having a little Water caſt upon them, to ſee whether will putrefie ſooner. Try it alſo with an Apple or Orange, having holes made in their tops, to ſee whether will rot or mould ſooner. Try it alſo with *Holland* Cheeſe, having Wine put into it, whether it will breed Mites ſooner or greater.

892.

For the increaſe of Moiſture, the opinion received is, that Seeds will grow ſooner, and Hair, and Nails, and Hedges, and Herbs, cut, &c. will grow ſooner, if they be ſet or cut in the increaſe of the Moon: Alſo, that Brains in Rabbits, Wood-cocks, Calves, &c. are fuller in the Full of the Moon; and ſo of Marrow in the Bones, and ſo of Oysters and Cockles; which of all the reſt are the eaſieſt tried, if you have them in Pits.

893.

Take ſome Seeds or Roots (as Onions, &c.) and ſet ſome of them immediately after the Change, and others of the ſame kinde immediately after the Full: Let them be as like as can be, the Earth alſo the ſame as near as may be, and therefore beſt in Pots: Let the Pots alſo ſtand where no Rain or Sun may come to them, leſt the difference of the Weather conſound the *Experiment*. And then ſee in what time the Seeds ſet, in the increaſe of the Moon, come to a certain height, and how they differ from thoſe that are ſet in the decreaſe of the Moon.

It is like, that the Brain of Man waxeth moister and fuller upon the Full of the Moon; and therefore it were good for those that have moist Brains, and are great Drinkers, to take fume of *Lignum Aloes*, *Rosemary*, *Frankincense*, &c. about the Full of the Moon. It is like also, that the Humors in Mens Bodies increase and decrease, as the Moon doth; and therefore it were good to purge some day or two after the Full, for that then the Humors will not replenish so soon again.

894.

As for the exciting of the motion of the Spirits, you must note, that the growth of Hedges, Herbs, Hair, &c. is caused from the Moon, by exciting of the Spirits, as well as by increase of the moisture. But for Spirits in particular, the great instance is in *Lunacies*.

895.

There may be other secret effects of the influence of the Moon, which are not yet brought into observation. It may be, that if it so fall out, that the Wind be North or North-East, in the Full of the Moon, it increaseth Cold; and if South or South-West, it disposeth the Air for a good while to warmth and rain; which would be observed.

896.

It may be that Children and young Cattel that are brought forth in the Full of the Moon, are stronger and larger then those that are brought forth in the Wane; and those also which are begotten in the Full of the Moon: So that it might be good Husbandry, to put Rams and Bulls to their Females somewhat before the Full of the Moon. It may be also, that the Eggs laid in the Full of the Moon, breed the better Birds; and a number of the like effects, which may be brought into observation. *Quare* also, whether great Thunders and Earth-quakes be not most in the Full of the Moon.

897.

THe turning of Wine to Vinegar, is a kinde of Putrefaction; and in making of Vinegar, they use to set Vessels of Wine over against the Noon Sun, which calleth out the more Oily Spirits, and leaveth the Liquor more sour and hard. We see also, that Burnt-Wine is more hard and astringent then Wine unburnt. It is said, that *Cider* in Navigations under the Line ripeneth, when *Wine* or *Beer* soureth. It were good to set a Rundlet of *Verjuice* over against the Sun in Summer, as they do Vinegar, to see whether it will ripen and sweeten.

898.

Experiment Solitary, touching Vinegar.

THere be divers Creatures that sleep all Winter; as the *Bear*, the *Hedgehog*, the *Bat*, the *Bee*, &c. These all wax fat when they sleep, and egest not. The cause of their fattening, during their sleeping time, may be the want of assimilating; for whatsoever assimilateth not to Flesh, turneth either to sweat or fat. These Creatures, for part of their sleeping time, have been observed not to stir at all; and for the other part, to stir, but not to remove, and they get warm and close places to sleep in. When the *Flemmings* wintred in *Nova Zembla*, the *Bears* about the middle of *November* went to sleep; and then the *Foxes* began to come forth, which durst not before. It is noted by some of the *Anciens*, that the She Bear breedeth, and lieth in with her young during that time of Rest, and that a Bear big with young, hath seldom been seen.

899.

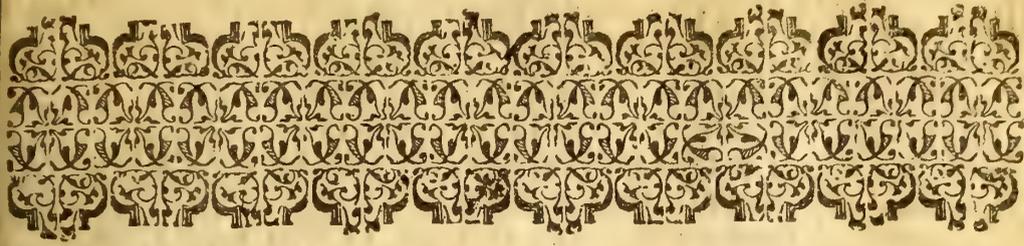

Experiment Solitary, touching Creatures that sleep all Winter.

Some *Living Creatures* are procreated by Copulation between Male and Female, some by Putrefaction; and of those which come by Putrefaction, many do (nevertheless) afterwards procreate by Copulation. For the cause of both Generations: First, it is most certain, that the cause of all Vivification,

900.

Experiment Solitary, touching the Generation of Creatures by Copulating, and by Putrefaction.

fication is a gentle and proportionable heat, working upon a glutinous and yielding substance; for the heat doth bring forth Spirit in that substance, and the substance being glutinous, produceth two effects; the one, That the Spirit is detained, and cannot break forth; the other, That the matter being gentle and yielding, is driven forwards by the motion of the Spirits, after some swelling into shape and members. Therefore all Sperm, all Menstruous substance, all matter whereof Creatures are produced by Putrefaction, have evermore a Closeness, Lensor, and Sequacity. It seemeth therefore that the Generation by Sperm onely, and by Putrefaction, have two different causes. The first is, for that Creatures which have a definite and exact shape (as those have which are procreated by Copulation) cannot be produced by a weak and casual heat; nor out of matter, which is not exactly prepared according to the Species. The second is, for that there is a greater time required for Maturation of perfect Creatures; for if the time required in Vivification be of any length, then the Spirit will exhale before the Creature be mature; except it be inclosed in a place where it may have continuance of the heat, access of some nourishment to maintain it, and closeness that may keep it from exhaling; and such places, or the Wombs and Matrices of the Females: And therefore all Creatures made of Putrefaction, are of more uncertain shape, and are made in shorter time, and need not so perfect an enclosure, though some closeness be commonly required. As for the Heathen opinion, which was, That upon great mutations of the World, perfect Creatures were first ingendred of Concretion, as well as Frogs, and Worms, and Flies, and such like, are now; we know it to be vain: But if any such thing should be admitted, discoursing according to sense, it cannot be, except you admit of a *Chaos* first, and commixture of Heaven and Earth; for the Frame of the World once in order, cannot effect it by any excess or casualty.

NATURAL HISTORY.

Century X.

The Philosophy of *Pythagoras* (which was full of Superstition) did first plant a Monstrous Imagination, which afterwards was, by the School of *Plato*, and others, watered and nourished. It was, That the *World* was one entire perfect Living Creature; in so much, as *Apollonius* of *Tyana*, a *Pythagorean* Prophet, affirmed, That the Ebbing and Flowing of the Sea was the Respiration of the World, drawing in Water as Breath, and putting it

forth again. They went on, and inferred, That if the World were a Living Creature, it had a Soul and Spirit; which also they held, calling it *Spiritus Mundi*, the Spirit or Soul of the World; by which, they did not intend God, (for they did admit of a *Deity* besides) but onely the Soul, or Essential Form of the Universe. This Foundation being laid, they might build upon it what they would; for in a Living Creature, though never so great (as for example, in a great Whale) the Sense and the Affects of any one part of the Body instantly make a Transcursion throughout the whole Body: So that by this they did insinuate, that no distance of place, nor want or indisposition of Matter, could hinder Magical Operations; but that (for example) we might here in *Europe* have Sense and Feeling of that which was done in *China*; and likewise, we might work any effect without and against Matter: And this not holden by the co-operation of Angels or Spirits, but onely by the Unity and Harmony of Nature. There were some also that staid not here, but went further, and held, That if the Spirit of Man (whom they call the *Microcosm*) do give a fit touch to the Spirit of the World, by strong Imaginations and Beliefs, it might command Nature; for *Paracelsus*, and some darksome Authors of Magick, do ascribe to Imagination exalted the Power of Miracle-working Faith. With these vast and bottomless Follies Men have been (in part) entertained.

Experiments
in Consort,
touching
Transmission
and Influx of
Immaterial
Virtues, and
the Force of
Imagination.

But we, that hold firm to the Works of God, and to the Sense, which is Gods Lamp, (*Lucerna Dei Spiraculum Hominis*) will enquire with all Sobriety and Severity, whether there be to be found in the Foot-steps of Nature any such Transmission and Influx of Immateriate Virtues ; and what the force of Imagination is, either upon the Body Imaginant, or upon another Body : Wherein it will be like that labor of *Hercules* in purging the Stable of *Augeas*, to separate from Superstitious and Magical Arts and Observations, any thing that is clean and pure Natural, and not to be either contemned or condemned. And although we shall have occasion to speak of this in more places then one, yet we will now make some entrance thereinto.

901.
Experiments
in Consort
Mentory,
touching
Transmission
of Spirits, and
the Force of
Imagination.

MEN are to be admonished, that they do not withdraw credit from the Operations by Transmission of Spirits and Force of Imagination because the effects fail sometimes. For as in Infection and Contagion from Body to Body, (as the Plague, and the like) it is most certain, that the Infection is received (many times) by the Body Passive, but yet is by the strength and good disposition thereof repulled, and wrought out, before it be formed into a Disease ; so much more in Impressions from Minde to Minde, or from Spirit to Spirit, the Impression taketh, but is encountred and overcome by the Minde and Spirit, which is Passive, before it work any manifest effect : And therefore they work most upon weak Mindes and Spirits ; as those of Women, Sick Persons, Superstitious and fearful Persons, Children, and young Creatures.

Nescio quis teneros oculus mihi fascinat Agnos :

The Poet speaketh not of Sheep, but of Lambs. As for the weakness of the Power of them upon Kings and Magistrates, it may be ascribed (besides the main, which is the Protection of God over those that execute his place) to the weakness of the Imagination of the Imaginant ; for it is hard for a Witch or a Sorcerer to put on a belief, that they can hurt such persons.

902.

Men are to be admonished on the other side, that they do not easily give place and credit to these operations, because they succeed many times: For the cause of this success is (oft) to be truly ascribed unto the force of Affection and Imagination upon the Body Agent, and then by a secondary means it may work upon a diverse Body. As for example, If a man carry a Planets Seal or a Ring, or some part of a Beast, believing strongly that it will help him to obtain his Love, or to keep him from danger of hurt in Fight, or to prevail in a Sute, &c. it may make him more active and industrious ; and again, more confident and persisting, then otherwise he would be. Now the great effects that may come of Industry and Perseverance (especially in civil business) who knoweth not ? For we see audacity doth almost binde and mate the weaker sort of Mindes ; and the state of Humane Actions is so variable, that to try things oft, and never to give over, doth wonders: Therefore it were a meer fallacy and mistaking to ascribe that to the Force of Imagination upon another Body, which is but the Force of Imagination upon the proper Body ; for there is no doubt but that Imagination and vehement Affection work greatly upon the Body of the Imaginant, as we shall shew in due place.

903.

Men are to be admonished, that as they are not to mistake the causes of these Operations, so much less they are to mistake the Fact or Effect, and rashly to take that for done which is not done. And therefore, as divers wise Judges have prescribed and cautioned, Men may not too rashly believe

believe the Confession of Witches, nor yet the evidence against them: For the Witches themselves are Imaginative, and believe oft-times they do that which they do not; and people are credulous in that point, and ready to impute Accidents and Natural operations to Witchcraft. It is worthy the observing, that both in ancient and late times, (as in the *Thessalian* Witches, and the meetings of Witches that have been recorded by so many late Confessions) the great wonders which they tell of carrying in the Air, transforming themselves into other Bodies, &c. are still reported to be wrought, not by Incantation or Ceremonies, but by Ointments and Anointing themselves all over. This may justly move a Man to think, that these Fables are the effects of Imagination; for it is certain, that Ointments do all (if they be laid on any thing thick) by stopping of the Pores, shut in the Vapor, and send them to the head extremly. And for the particular Ingredients of those Magical Ointments, it is like they are opiate and soporiferous. For Anointing of the Forehead, Neck, Feet, Back-bone, we know is used for procuring dead sleeps. And if any Man say, that this effect would be better done by inward potions; answer may be made, that the Medicines which go to the Ointments are so strong, that if they were used inwards, they would kill those that use them; and therefore they work potently, though outwards.

We will divide the several kinds of the operations by transmission of Spirits and Imagination, which will give no small light to the *Experiments* that follow. All operations by transmission of Spirits and Imagination have this, that they work at distance, and not at touch; and they are these being distinguished.

The first is, The Transmission or Emission of the thinner and more airy parts of Bodies, as in Odors and Infections; and this is, of all the rest, the most corporeal. But you must remember withal, that there be a number of those Emissions, both unwholesome and wholesome, that give no smell at all: For the Plague many times when it is taken giveth no sent at all, and there be many good and healthful Airs, as they appear by Habitation, and other proofs, that differ not in Smell from other Airs. And under this head you may place all Imbibitions of Air, where the substance is material, odor-like, whereof some nevertheless are strange, and very suddenly diffused; as the alteration which the Air receiveth in *Egypt* almost immediately upon the rising of the River of *Nilus*, whereof we have spoken.

The second is, the Transmission or Emission of those things that we call Spiritual Species, as VISIBLES and SOUNDS; the one whereof we have handled, and the other we shall handle in due place. These move swiftly and at great distance, but then they require a *Medium* well disposed, and their Transmission is easily stopped.

The third is, the Emissions which cause Attraction of certain Bodies at distance; wherein though the Loadstone be commonly placed in the first rank, yet we think good to except it, and refer it to another Head: But the drawing of *Amber*, and *Jet*, and other *Electric* Bodies, and the Attraction in *Gold* of the Spirit of *Quick-silver* at distance, and the Attraction of Heat at distance, and that of fire to *Naphtha*, and that of some Herbs to Water, though at distance, and divers others, we shall handle; but yet not under this present title, but under the title of Attraction in general.

904.

905.

906.

907.

The fourth is, the Emission of Spirits, and Immaterial Powers and Virtues, in those things which work by the universal configuration and Sympathy of the World; not by Forms, or Celestial Influxes, (as is vainly taught and received) but by the Primitive Nature of Matter, and the seeds of things. Of this kinde is (as we yet suppose) the working of the Loadstone, which is by consent with the Globe of the Earth; of this kinde is the motion of Gravity, which is by consent of dense Bodies with the Globe of the Earth: Of this kinde is some disposition of Bodies to Rotation, and particularly from East to West; of which kinde, we conceive the Main Float and Refloat of the Sea is, which is by consent of the Universe, as part of the *Diurnal Motion*. These *Immaterial Virtues* have this property differing from others, that the diversity of the *Medium* hindreth them not, but they pass through all *Mediums*, yet at determinate distances. And of these we shall speak, as they are incident to several Titles.

908.

The fifth is, the Emission of Spirits; and this is the principal in our intention to handle now in this place, namely, the operation of the Spirits of the minde of Man upon other Spirits; and this is of a double nature; the operation of the Affections, if they be vehement; and the operation of the Imagination, if it be strong. But these two are so coupled, as we shall handle them together; for when an envious or amorous aspect doth infect the Spirits of another, there is joyned both Affection and Imagination.

909.

The sixth is, the influxes of the *Heavenly Bodies*, besides those two manifest ones of Heat and Light. But these we will handle, where we handle the *Celestial Bodies and Motions*.

910.

The seventh is, the operations of *Sympathy*, which the Writers of *Natural Magick* have brought into an *Art or Precept*; and it is this, That if you desire to super-induce any *Virtue or Disposition* upon a Person, you should take the *Living Creature*, in which that *Virtue* is most eminent and in perfection; of that *Creature* you must take the parts wherein that *Virtue* chiefly is collocate. Again, you must take the parts in the time, and act when that *Virtue* is most in exercise, and then you must apply it to that part of Man, wherein that *Virtue* chiefly consisteth. As if you would super-induce *Courage and Fortitude*, take a *Lion*, or a *Cock*; and take the *Heart, Tooth, or Paw* of the *Lion*; or the *Heart, or Spur* of the *Cock*: Take those parts immediately after the *Lion* or the *Cock* have been in fight, and let them be worn upon a Mans heart or wrist. Of these and such like *Sympathies* we shall speak under this present Title.

911.

The eighth and last is, an Emission of *Immaterial Virtues*, such as we are a little doubtful to propound it is so prodigious, but that it is so constantly avouched by many: And we have set it down as a Law to our selves, to examine things to the bottom; and not to receive upon credit, or reject upon improbabilities, until there hath passed a due examination. This is the *Sympathy of Individuals*; for as there is a *Sympathy of Species*, so (it may be) there is a *Sympathy of Individuals*; that is, that in things, or the parts of things that have been once contiguous or entire, there should remain a transmission of *Virtue* from the one to the other, as between the *Weapon* and the *Wound*. Whereupon is blazed abroad the operation of *Unguentum Teli*, and so of a piece of *Lard*, or stick of *Elder*, &c. That if part of it be consumed or putrefied, it will work upon the other parts severed. Now we will pursue the instances themselves.

THe *Plague* is many times taken without manifest sense, as hath been said; and they report, that where it is found it hath a sent of the smell of a Mellow Apple, and (as some say) of May-flowers: And it is also received, that smells of Flowers that are Mellow and Lushious, are ill for the *Plague*; as *White Lilies*, *Covvslips*, and *Hyacinths*.

The *Plague* is not easily received by such as continually are about them that have the *Plague*, as *Keepers* of the Sick, and *Physicians*; nor again by such as take *Antidotes*, either inward (as *Mithridate*, *Juniper-berries*, *Rue*, *Leaf*, and *Seed*, &c.) or outward (as *Angelica*, *Zedoary*, and the like in the Mouth; *Tar*, *Galbanum*, and the like in Perfume :) Nor again, by old people, and such as are of a dry and cold complexion. On the other side, the *Plague* taketh soonest hold of those that come out of a fresh Air, and of those that are fasting, and of Children; and it is likewise noted to go in a Blood more then to a stranger.

The most pernicious Infection, next the *Plague*, is the smell of the Goal, when Prisoners have been long, and close, and nastily kept; whereof we have had in our time, experience twice or thrice; when both the *Judges* that sat upon the Goal, and numbers of those that attended the businets, or were present, sickned upon it, and died. Therefore it were good wisdom, that in such cases the Goal were aired before they be brought forth.

Out of question, if such foul smells be made by Art, and by the Hand, they consist chiefly of Mans flesh, or sweat, putrefied; for they are not those stinks which the Nostrils straight abhor and expel, that are most pernicious, but such Airs as have some similitude with Mans body, and so insinuate themselves, and berray the *Spirits*. There may be great danger in using such Compositions in great Meetings of People within Houses; as in *Churches*, at *Arraignments*, at *Plays* and *Solemnities*, and the like: For poysoning of Air is no lets dangerous, then poysoning of Water, which hath been used by the *Turkes* in the Wars, and was used by *Emanuel Comnenus* towards the *Christians*, when they passed through his COUNTRY to the *Holy Land*. And these empoysonments of Air are the more dangerous in Meetings of People, because the much breath of People doth further the reception of the Infection. And therefore when any such thing is feared, it were good those publick places were perfumed before the *Assemblies*.

The empoysonment of particular persons by Odors, hath been reported to be in perfumed Gloves, or the like. And it is like they mingle the poyson that is deadly with some smells that are sweet, which also maketh it the sooner received. *Plagues* also have been raised by Anointings of the Chinks of Doors, and the like; not so much by the touch, as for that it is common for men, when they finde any thing wet upon their fingers, to put them to their Nose; which men therefore should take heed how they do. The best is, that these Compositions of Infectious Airs cannot be made without dangers of death to them that make them; but then again, they may have some *Antidotes* to save themselves; so that men ought not to be secure of it.

There have been in divers Countreys great *Plagues* by the putrefaction of great swarms of *Grasshoppers* and *Locusts*, when they have been dead and cast upon heaps.

It hapneth oft in *Mines*, that there are Damps which kill either by Suffocation, or by the poysonous nature of the *Mineral*; and those that deal

916.

917.

918.

deal much in Refining, or other works about Metals and Minerals, have their Brains hurt and itupified by the Metalline Vapors. Amongst which, it is noted, that the Spirits of Quick-silver ever flie to the Skull, Teeth, or Bones; insomuch, as *Gilders* use to have a piece of Gold in their Mouth to draw the Spirits of Quick-silver; which Gold afterwards they finde to be whitned. There are also certain Lakes and Pits, such as that of *Avernus*, that poyson Birds (as is said) which flie over them, or Men that stay too long about them.

919.

The Vapor of Char-coal or Sea-coal in a close room; hath killed many; and it is the more dangerous, because it cometh without any ill smell, but stealerh on by little and little, inducing onely faintness, without any manifest strangling. When the *Dutchmen* wintred at *Nova Zembla*, and that they could gather no more sticks, they fell to make fire of some Sea-coal they had, wherewith (at first) they were much refreshed; but a little after they had sat about the fire, there grew a general silence and lothness to speak amongst them; and immediately after, one of the weakest of the Company fell down in a swoon: Whereupon, they doubting what it was, opened their doot to let in Air, and so saved themselves. The effect (no doubt) is wrought by the inspissation of the Air, and so of the Breath and Spirits. The like ensueth in Rooms newly Plaistred, if a fire be made in them; whereof no less Man then the Emperor *Jovianus* died.

920

Vide the Experiment 803. Touching the *Infectious Nature* of the Air upon the first Showers after long Drought.

921.

It hath come to pass, that some *Apothecaries*, upon stamping of *Coloquintida*, have been put into a great Scouring by the Vapor onely.

922.

It hath been a practice to burn a *Pepper* they call *Guinny-Pepper*, which hath such a strong Spirit, that it provoketh a continual *SneeZing* in those that are in the Room.

923.

It is an Ancient Tradition, that *Blear Eyes* infect *Sound Eyes*; and that a *Menstruous Woman* looking in a Glass doth rust it: Nay, they have an opinion, which seemeth fabulous, That *Menstruous Women* going over a *Field* or *Garden*, do *Corn* and *Herbs* good by killing the Worms.

924.

The Tradition is no less ancient, that the *Basilisk* killeth by aspect; and that the *Woolf*, if he seeth a *Man* first, by aspect striketh a *Man* hoarse.

925.

Perfumes convenient do dry and strengthen the Brain, and stay Rheums and Defluxions; as we finde in Fume of *Rosemary* dried, and *Lignum Aloes*, and *Calamus* taken at the Mouth and Nostrils. And no doubt, there be other Perfumes that do moisten and refresh, and are fit to be used in Burning Agues, Consumptions, and too much wakefulness; such as are *Rose-water*, *Vinegar*, *Lemmon-pills*, *Violets*, the Leaves of *Vines* sprinkled with a little *Rose-water*, &c.

926.

They do use in sudden Faintings and Swoonings, to put a Handkerchief with *Rose-water*, or a little *Vinegar* to the Nose, which gathereth together again the Spirits, which are upon point to resolve and fall away.

927.

Tobacco comforteth the Spirits, and dischargeth weariness; which it worketh, partly by opening, but chiefly by the opiate virtue, which condenseth the Spirits. It were good therefore to try the taking of Fumes by Pipes (as they do in *Tobacco*) of other things, as well to dry and comfort, as for other intentions. I wish tryal be made of the drying Fume of *Rosemary* and *Lignum Aloes*, before mentioned in Pipe; and so of *Nutmegs* and *Folium Indum*, &c.

The following of the Plough hath been approved for refreshing the Spirits, and procuring Appetite; but to do it in the Ploughing for Wheat or Rye is not so good, because the Earth hath spent her sweet breath in Vegetables put forth in Summer. It is better therefore to do it when you sow Barley. But because Ploughing is tied to Seasons, it is best to take the Air of the Earth new turned up by digging with the Spade, or standing by him that diggeth. *Gentlewomen* may do themselves much good by kneeling upon a Cushion, and Weeding. And these things you may practise in the best Seasons; which is ever the early Spring, before the Earth putteth forth the Vegetables, and in the sweetest Earth you can chuse. It would be done also when the Dew is a little off the Ground, lest the Vapor be too moist. I knew a great Man that lived long, who had a clean Clod of Earth brought to him every morning as he late in his Bed; and he would hold his head over it a good pretty while. I commend also sometimes in digging of new Earth, to pour in some Malmsey or Greek Wine, that the Vapor of the Earth and Wine together may comfort the Spirits the more; provided always it be not taken for a Heathen Sacrifice or Libation to the Earth.

928.

They have in *Physick* use of *Pomanders*, and knots of Powders for drying of Rheums, comforting of the Heart, provoking of Sleep, &c. for though those things be not so strong as Perfumes, yet you may have them continually in your hand, whereas Perfumes you can take but at times; and besides, there be divers things that breath better of themselves then when they come to the Fire; as *Nigella Romana*, the Seed of *Melanthium*, *Amomum*, &c.

929.

There be two things which (inwardly used) do cool and condense the Spirits; and I wish the same to be tried outwardly in Vapors. The one is *Nure*; which I would have dissolved in Malmsey, or Greek Wine, and so the smell of the Wine taken; or, if you would have it more forcible, pour of it upon a Fire-pan well heated, as they do *Rose-water* and *Vinegar*. The other is, the distilled Water of Wilde Poppey; which I wish to be mingled at half with *Rose-water*, and so taken with some mixture of a few Cloves in a Perfuming-pan. The like would be done with the distilled Water of Saffron-Flowers.

930.

Smells of *Musk*, and *Amber*, and *Civet*, are thought to further Venerous Appetite; which they may do by the refreshing and calling forth of the Spirits.

931.

Incense and Niderous smells (such as were of *Sacrifices*) were thought to intoxicate the Brain, and to dispose men to devotion; which they may do by a kinde of sadness and contristation of the Spirits, and partly also by Heating and Exalting them. We see that amongst the Jews, the principal perfume of the Sanctuary was forbidden all common uses.

932.

There be some Perfumes prescribed by the Writers of *Natural Magick*, which procure pleasant Dreams; and some others (as they say) that procure Prophetical Dreams, as the Seeds of *Flax*, *Fleawort*, &c.

933.

It is certain, that Odors do in a small degree, nourish, especially the Odor of Wine; and we see Men an hungred do love to smell hot Bread. It is related, that *Democritus* when he lay a dying, heard a Woman in the House complain, that she should be kept from being at a Feast and Solemnity (which she much desired to see) because there would be a Corps in the Houle: Whereupon he caused Loaves of new Bread to be sent for, and opened them, and poured a little Wine into them, and so kept himself alive with the

934.

the

the Odor of them till the Feast was past. I knew a Gentleman that would fast (sometimes) three or four, yea, five days, without Meat, Bread, or Drink; but the same Man used to have continually a great Wisp of Herbs that he smelled on, and amongst those Herbs some esculent Herbs of strong sent, as *Onions, Garlick, Leeks,* and the like.

935.

They do use for the Accident of the *Mother* to burn Feathers, and other things of ill Odor; and by those ill smells the rising of the *Mother* is put down.

936.

There be Airs which the Physicians advise their Patients to remove unto in *Consumptions*, or upon recovery of long sicknesses, which (commonly) are plain *Champaigns*, but *Grasing*, and not over-grown with *Heath*, or the like; or else *Timber-shades*, as in *Forests*, and the like. It is noted also, that *Groves of Bays* do forbid *Pestilent Airs*; which was accounted a great cause of the wholesome Air of *Antiochia*. There be also some Soyls that put forth *Odorate Herbs* of themselves, as *VVilde Thyme, VVilde Marjoram, Penny-royal, Camomile*; and in which, the *Bryar-Roses* smell almost like *Musk-Roses*; which (no doubt) are signs that do discover an excellent Air.

937.

It were good for men to think of having healthful Air in their Houses; which will never be, if the Rooms be low-roofed, or full of Windows and Doors; for the one maketh the Air close, and not fresh; and the other, maketh it exceeding unequal, which is a great enemy to health. The Windows also should not be high up to the Roof (which is in use for Beauty and Magnificence) but low. Also *Stone-walls* are not wholesome; but *Timber* is more wholesome, and especially *Brick*; nay, it hath been used by some with great success, to make their Walls thick, and to put a Lay of *Chalk* between the Bricks to take away all dampishness.

938.

Experiment
Solitary,
touching the
Emissions of
Spiritual Spe-
cies, which
affect the
Senses.

THESE Emissions (as we said before) are handled, and ought to be handled by themselves, under their proper Titles; that is, *Visibles*, and *Audibles*, each apart: In this place, it shall suffice to give some general Observations common to both. First, they seem to be *Incorporeal*. Secondly, they work swiftly. Thirdly, they work at large distances. Fourthly, in curious varieties. Fifthly, they are not effective of any thing, nor leave any work behind them, but are energies meerly; for their working upon mirrors and places of *Echo* doth not alter any thing in those Bodies; but it is the same Action with the Original, onely repercussed. And as for the shaking of Windows, or rarifying the Air by great noises, and the Heat caused by *Burning Glasses*, they are rather *Concomitants* of the *Audible* and *Visible* Species, then the effects of them. Sixthly, they seem to be of so tender and weak a Nature, as they affect onely such a *Rare* and *Attenuate* Substance as is the *Spirit of Living Creatures*.

Experiments
in Consort,
touching
Emission of
Immaterial
Virtues from
the Mindes
and Spirits of
Men, either by
Affections, or
by Imaginati-
ons, or by other
Impressions.

IT is mentioned in some Stories, that where Children have been exposed or taken away young from their Parents, and that afterward they have approached to their Parents presence, the Parents (though they have not known them) have had a secret Joy, or other Alteration thereupon.

There was an *Egyptian Soothsayer* that made *Anonius* believe, that his *genius* (which otherwise was brave and confident) was, in the presence of *Octavianus Caesar*, poor and cowardly; and therefore, he advised him to absent himself (as much as he could) and remove far from him. The *Soothsayer* was thought to be suborned by *Cleopatra*, to make him live in *Egypt*, and other remote

940.

remote places from *Rome*. Howsoever, the conceit of a predominant or mastering Spirit of one Man over another is ancient, and received still, even in vulgar opinion.

There are conceits, that some Men that are of an ill and melancholly nature, do incline the company into which they come, to be sad and ill disposed; and contrariwise, that others that are of a jovial nature do dispose the company to be merry and chearful: And again, that some Men are lucky to be kept company with, and employed, and others unlucky. Certainly it is agreeable to reason, that there are at the least some light effluxions from Spirit to Spirit when Men are in presence one with another, as well as from Body to Body.

It hath been observed, that old Men have loved young company, and been conversant continually with them, have been of long life; their Spirits (as it seemeth) being recreated by such company. Such were the Ancient Sophists and Rhetoricians, which ever had young Auditors and Disciple; as *Gorgias, Protagoras, Isocrates, &c.* who lived till they were an hundred years old; and so likewise did many of the *Grammarians* and *School-masters*: Such as was *Orbilius, &c.*

Audacity and confidence doth, in civil businesses, so great effects, as a Man may (reasonably) doubt, that besides the very daring, and earnestness, and persisting, and importunity, there should be some secret binding and stooping of other Mens spirits to such persons.

The Affections (no doubt) do make the Spirits more powerful and active, and especially those Affections which draw the Spirits into the Eyes; which are two, Love and Envy, which is called *Oculus Malus*. As for Love, the *Platonists* (some of them) go so far, as to hold, That the Spirit of the Lover doth pass into the Spirits of the person loved, which causeth the desire of return into the Body whence it was emitted, whereupon followeth that appetite of contract and conjunction which is in Lovers. And this is observed likewise, that the Aspects that procure Love, are not gazings, but sudden glances and darrings of the Eye. As for Envy, that emitteth some malign and poisonous Spirits, which take hold of the Spirit of another; and is likewise of greatest force, when the Cast of the Eye is oblique. It hath been noted also, That it is most dangerous, where the envious Eye is cast upon persons in glory, and triumph, and joy. The reason whereof is, for that at such times the Spirits come forth most into the outward parts, and so meet the percussio of the envious eye more at hand; and therefore it hath been noted, That after great triumphs, Men have been ill disposed for some days following. We see the opinion of Fascination is ancient for both effects, of procuring Love, and sickness caused by Envy; and Fascination is ever by the Eye. But yet if there be any such infection from Spirit to Spirit, there is no doubt, but that it worketh by presence, and not by the Eye alone, yet most forcibly by the Eye.

Fear and Shame are likewise infective: For we see that the starting of one, will make another ready to start, and when one man is out of countenance in a company, others do likewise blush in his behalf.

Now we will speak of the *Force of Imagination* upon other *Bodies*, and of the means to exalt and strengthen it. Imagination, in this place, I understand to be the representation of an Individual Thought. Imagination is of three Kinds; the first joyned with *Belief* of that which is to come; the second, joyned with *Memory* of that which is past; and the third is, of *Things present*, or as if they were present: For I comprehend in this, Imagination feigned,

941.

942.

943.

944.

945.

feigned, and at pleasure : As if one should imagine such a Man to be in the Vestments of a Pope, or to have Wings. I single out for this time that which is with Faith or Belief of that which is to come. The Inquisition of this Subject in our way (which is by Induction) is wonderful hard, for the things that are reported are full of Fables ; and new Experiments can hardly be made but with extream Caution, for the Reason which we will after declare.

The Power of Imagination is in three kinds. The first, upon the Body of the imaginant, including likewise the Childe in the Mothers Womb. The second is, the power of it upon dead bodies, as Plants, Wood, Stone, Metal, &c. The third is, the power of it upon the Spirits of Men and Living Creatures. And with this last we will onely meddle.

The Probleme therefore is, Whether a Man constantly and strongly believing that such a thing shall be, (as that such an one will love him, or that such an one will grant him his request, or that such an one shall recover a sickness, or the like) it doth help any thing to the effecting of the thing it self. And here again we must warily distinguish ; for it is not meant (as hath been partly said before) that it should help by making a man more stout, or more industrious ; (in which kinde, constant belief doth much) but meerly by a secret operation, or binding, or changing the Spirit of another. And in this it is hard (as we began to say) to make any new experiment ; for I cannot command my self to believe what I will, and so no tryal can be made. Nay it is worse, for whatsoever a Man imagineth doubtingly, or with fear, must needs do hurt, if Imagination have any power at all ; for a Man representeth that oftner that he feareth, then the contrary.

The help therefore is, for a Man to work by another, in whom he may create belief, and not by himself, until himself have found by experience, that Imagination doth prevail ; for then experience worketh in himself Belief, if the Belief that such a thing shall be joyned with a Belief, that his Imagination may procure it.

946.

For example, I related one time to a Man that was curious and vain enough in these things, That I saw a kinde of Jugler that had a Pair of Cards, and would tell a man vvhhat Card he thought. This pretended Learned Man told me, it was a mistaking in me. For (said he) it vvas not the knowledg of the Mans thoughts (for that is proper to God) but it vvas the insforcing of a thought upon him, and binding his Imagination by a stronger, that he could think no other Card. And thereupon he asked me a Question or two, which I thought he did but cunningly, knowing before what used to be the feats of the Jugler. Sir, (said he) do you remember vvhether he told the Card the Man thought himself, or had another to tell it ? I answered, (as was true) That he had another tell it. Whereunto he said, So I thought : For (said he) himself could not have put on so strong an Imagination, but by telling the other the Card (vvhho believed, that the Jugler vvas some strange man, and could do strange things) that other man caught a strong Imagination. I hearkned unto him, thinking for a vanity he spake prettily. Then he asked me another Question : Saith he, Do you remember vvhether he had the Man think the Card first, and afterwards told the other Man in his Ear what he should think ; or else, that he did whisper first in the Mans Ear that should tell the Card, telling, That such a Man should think such a Card, and after had the Man think a Card ? I told him, (as was true) That he did first whisper the Man in the Ear, that such a Man should think such a Card. Upon this, the Learned Man did much exult and please himself, saying, Lo, you may see that my opinion is right : For if the Man had thought first, his thought had been fixed ; but the other imagining first, bound his thought. Which though it did somewhat sink with me, yet I made

made it lighter then I thought, and said, *I thought it was confederacy between the Jugler, and the two Servants*; though (indeed) I had no reason so to think. for they were both my Fathers servants, and he had never plaid in the House before. The *Jugler* also did cause a Garter to be held up, and took upon him to know that such an one should point in such a place of the Garter, as it should be near so many Inches to the longer end, and so many to the shorter; and still he did it by first telling the imaginer, and after bidding the actor think.

Having told this Relation, not for the weight thereof, but because it doth handsomly open the nature of the Question, I return to that I said, That *Experiments of Imagination* must be practised by others, and not by a Mans self. For there be three means to fortifie Belief; the first is Experience, the second is Reason, and the third is Authority. And that of these which is far the most potent, is Authority: For Belief upon Reason or Experience will stagger.

For Authority, it is of two kindes: Belief in an Art, and Belief in a Man. And for things of Belief in an Art, a Man may exercise them by himself; but for Belief in a Man, it must be by another. Therefore if a Man believe in Astrology, and finde a figure prosperous; or believe in Natural Magick, and that a Ring with such a Stone, or such a piece of a Living Creature carried, will do good, it may help his Imagination; but the Belief in a Man is far the more active. But howsoever all Authority must be out of a Mans self, turned (as was said) either upon an Art, or upon a Man; and where Authority is from one Man to another, there the second must be Ignorant, and not learned, or full of thoughts: And such are (for the most part) all Witches and superstitious persons, whose beliefs, tied to their Teachers and Traditions, are no whit controlled either by Reason or Experience: And upon the same reason, in Magick they use (for the most part) Boys and young People, whose spirits easiliest take Belief and Imagination.

Now to fortifie Imagination, there be three ways: The Authority whence the Belief is derived; Means to quicken and corroborate the Imagination; and Means to repeat it and refresh it.

For the Authority we have already spoken. As for the second, namely, the Means to quicken and corroborate the Imagination, we see what hath been used in Magick; (if there be in those practices any thing that is purely Natural) as Vestments, Characters, Words, Seals, some parts of Plants, or Living Creatures, Stones, choice of the Hour, Gestures and Motions; also Incenses and Odors, choice of Society, which increaseth Imagination, Diets and Preparations for some time before. And for Words, there have been ever used, either barbarous words of no sense, lest they should disturb the Imagination; or words of similitude, that may second and feed the Imagination: And this was ever as well in Heathen Charms, as in Charms of later times. There are used also Scripture words, for that the Belief that Religious Texts and Words have power, may strengthen the Imagination. And for the same reason Hebrew words (which amongst us is counted the holy Tongue, and the words more mystical) are often used.

For the refreshing of the Imagination (which was the third Means of Exalting it) we see the practices of Magick; as in Images of Wax, and the like, that should melt by little and little, or some other things buried in Muck, that should putrefie by little and little, or the like: For so oft as the Imaginant doth think of those things, so oft doth he represent to his Imagination the effect of that he desireth.

947.

948.

49.

950.

If there be any power in Imagination, it is less credible that it should be so incorporeal and immaterial a Virtue, as to work at great distances, or through all *Mediums*, or upon all Bodies; but that the distance must be competent, the *Medium* not adverse, and the Body apt and proportionate. Therefore if there be any operation upon Bodies in absence by Nature, it is like to be conveyed from Man to Man, as *Fame* is: As if a *Witch* by Imagination should hurt any afar off, it cannot be naturally, but by working upon the Spirit of some that cometh to the *Witch*, and from that party upon the Imagination of another, and so upon another, till it come to one that hath resort to the party intended; and so by him, to the party intended himself. And although they speak, that it sufficeth to take a Point, or a piece of the Garment, or the Name of the party, or the like; yet there is less credit to be given to those things, except it be by working of evil spirits.

The *Experiments* which may certainly demonstrate the power of Imagination upon other Bodies, are few or none; for the *Experiments* of *Witchcraft* are no clear proofs, for that they may be by a tacite operation of malignant Spirits; we shall therefore be forced in this Inquiry, to resort to new *Experiments*, wherein we can give onely Directions of Tryals, and not any *Positive Experiments*. And if any man think that we ought to have staid till we had made *Experiment* of some of them our selves, (as we do commonly in other Titles) the truth is, that these Effects of Imagination upon other Bodies, have so little credit with us, as we shall try them at leisure: But in the meantime we will lead others the way.

951.

When you work by the Imagination of another, it is necessary that he by whom you work have a precedent opinion of you that you can do strange things, or that you are a Man of Art, as they call it; for else the simple affirmation to another, that this or that shall be, can work but a weak impression in his Imagination.

952.

It were good, because you cannot discern fully of the strength of Imagination in one Man, more then another, that you did use the Imagination of more then one, that so you may light upon a strong one. As if a Physician should tell three or four of his Patients servants that their Master shall surely recover.

953.

The Imagination of one that you shall use (such is the variety of Mens mindes) cannot be always alike constant and strong; and if the success follow not speedily, it will faint and lose strength. To remedy this, you must pretend to him whose Imagination you use several degrees of Means by which to operate: As to prescribe him, that every three days, if he finde not the success apparent, he do use another Root, or part of a Beast, or Ring, &c. as being of more force; and if that fail, another; and if that, another, till seven times. Also you must prescribe a good large time for the effect you promise; as if you should tell a servant of a sick man, that his Master shall recover, but it will be fourteen days ere he findeth it apparently, &c. All this to entertain the Imagination, that it waver less.

954.

It is certain, that potions or things taken into the Body, Incenses and Perfumes taken at the Nostrils, and oynments of some parts, do (naturally) work upon the Imagination of him that taketh them. And therefore it must needs greatly cooperate with the Imagination of him whom you use, if you prescribe him, before he do use the Receipt for the Work which he desireth, that he do take such a Pill, or a spoonful of Liquor, or burn such an Incense, or anoint his Temples, or the Soles of his Feet, with such an Oynment or Oyl: And you must chuse for the Composition of such Pill, Perfume, or Oyl-

Oyntment, such Ingredients as do make the Spirits a little more gross or muddy, whereby the Imagination will fix the better.

The Body Passive, and to be wrought upon, (I mean not of the Imaginant) is better wrought upon (as hath been partly touched) at some times then at others; As if you should prescribe a servant about a sick person, (whom you have possessed that his Master shall recover) when his Master is fast asleep, to use such a Root, or such a Roor. For Imagination is like to work better upon sleeping men, then men awake; as we shall shew when we handle Dreams.

We finde in the *Art of Memory*, that *Images visible* work better then other conceits; As if you would remember the word *Philosophy*, you shall more surely do it by imagining that such a Man (for Men are best places) is reading upon *Aristotles Physicks*, then if you should imagine him to say, *I will go study Philosophy*. And therefore this observation would be translated to the subject we now speak of; for the more lustrous the Imagination is, it filleth and fixeth the better. And therefore I conceive, that you shall in that *Experiment* (whereof we spake before) of binding of thoughts, less fail, if you tell one that such an one shall name one of twenty men, then if it were one of twenty Cards. The *Experiment* of binding of thoughts would be diversified and tried to the full: And you are to note, whether it hit for the most part, though not always.

It is good to consider upon what things Imagination hath most force: And the rule (as I conceive) is, that it hath most force upon things that have the lightest and easiest motions; and therefore above all upon the Spirits of Men, and in them upon such affections as move lightest: As upon procuring of Love, binding of Lust, which is ever with Imagination upon Men in fear, or Men in irresolution, and the like: Whatsoever is of this kinde would be thoroughly enquired. Tryals likewise would be made upon Plants, and that diligently: As if you should tell a man that such a Tree would die this year, and will him at these and these times to go unto it, to see how it thrived. As for inanimate things, it is true, that the motions of shuffling of Cards, or casting of Dice, are very light motions; and there is a folly very useful, That Gamesters imagine, that some that stand by them, bring them ill luck. There would be tryal also made, of holding a Ring by a thred in a Glass, and telling him that holdeth it before, that it shall strike so many times against the side of the Glass, and no more; or of holding a Key between two Mens fingers without a charm; and to tell those that hold it, that at such a name it shall go off their fingers. For these two are extreame light motions. And howsoever, I have no opinion of these things, yet so much I conceive to be true, That strong Imagination hath more force upon things living, or that have been living, then things meerly inanimate; and more force likewise upon light and subtil motions, then upon motions vehement or ponderous.

It is an usual observation, That if the Body of one murdered be brought before the Murtherer, the wounds will bleed afresh. Some do affirm, That the dead Body, upon the presence of the Murtherer hath opened the eyes; and that there have been such like motions as well where the party murdered hath been strangled or drowned, as where they have been killed by wounds. It may be that this participateth of a miracle, by Gods just judgment, who usually brings murders to light. But if it be Natural, it must be referred to Imagination.

The tying of the point upon the day of Marriage, to make Men impo-

955.

956.

957.

958.

959.

tear towards their Wives, which (as we have formerly touched) is so frequent in *Zant* and *Gascony*, if it be Natural, must be referred to the Imagination of him that tieth the Point. I conceive it to have the less affinity with Witchcraft, because not peculiar persons onely, (such as Witches are) but any Body may do it.

960.
Experiments
in Confort
touching the
Secret Virtue
of Sympathy
and Anti-
pathy.

There be many things that work upon the *Spirits of Men* by *Secret Sympathy* and *Antipathy*. The virtues of *Precious Stones* worn, have been anciently and generally received, and curiously assigned to work severall effects. So much is true, that *Stones* have in them fine *Spirits*, as appeareth by their splendor: And therefore they may work by consent upon the *Spirits of Men*, to comfort and exhilarate them. Those that are the best for that effect, are the *Diamond*, the *Emerald*, the *Jacynth Oriental*, and the *Gold-stone*, which is the *yellow Topaz*. As for their particular Proprieties, there is no credit to be given to them. But it is manifest, that Light above all things, excelleth in comforting the *Spirits of Men*; and it is very probable, that Light varied doth the same effect with more novelty. And this is one of the causes why *Precious Stones* comfort. And therefore it were good to have *Tinted Lanthorns*, or *Tinted Skreens of Glas* coloured into *Green*, *Blue*, *Carnation*, *Crimson*, *Purple*, &c. and to use them with Candles in the night. So likewise to have round *Glasses*, not onely of *Glas* coloured through, but with Colours laid between *Crystals*, with handles to hold in ones hand. *Prisms* are also comfortable things. They have of *Paris-work*, *Looking-Glasses*, bordered with broad Borders of small *Crystal*, and great counterfeit *Precious Stones* of all Colours, that are most glorious and pleasant to behold, especially in the night. The *Pictures of Indian Feathers* are likewise comfortable and pleasant to behold. So also fair and clear *Pools* do greatly comfort the *Eyes Spirits*; especially when the *Sun* is not glaring but overcasty or when the *Moon* shineth.

961.

There be divers sorts of *Bracelets* fit to comfort the *Spirits*; and they be of three Intentions in *Refrigerant*, *Corroborant*, and *Aperient*. For *Refrigerant* I wish them to be of *Pearl*, or of *Coral*, as is used. And it hath been noted that *Coral* in the party that weareth it be ill disposed, will wax pale; which I believe to be true, because otherwise distemper of heat will make *Coral* lose colour. I commend also *Beads* or little *Plates* of *Lapis Lazuli*, and *Beads* of *Nire*, either alone, or with some *Cardial* mixture.

962.

For *Corroboration* and *Comfortation*, take such *Bodies* as are of *Astringent* quality without manifest cold. I commend *Bead Amber*, which is full of *Astringion*, but yet is unctuous, and not cold, and is conceived to impinguate those that wear such *Beads*. I commend also *Beads* of *Harts-Horn* and *Ivory*, which are of the like nature; also *Orange-Beads*; also *Beads* of *Lignum Aloes*, macerated first in *Rose-water* and dried.

963.

For opening, I commend *Beads*, or pieces of the *Roots* of *Carduus*, *Benedictus*, also of the *Roots* of *Penny*, the *Male*, and of *Orris*, and of *Calamus Aromaticus*, and of *Red*.

964.

The *Cramp* (no doubt) cometh of contraction of *Sinews*; which is manifest in that it cometh either by cold or driness, as after *Consumptions* and long *Agues* for *Cold* and *Driness* do (both of them) contract and corrugate. We see also, that chafing a little above the place in pain, caeth the *Cramp*; which is wrought by the Dilatation of the contracted *Sinews* by heat. There are in use for the prevention of the *Cramp*, two things. The one, *Rings* of *Sea-Horse Teeth* worn upon the *Fingers*; the other, *Bands*

of

of *Green Perwinckle* (the *Herb*) tied about the Calf of the Leg, or the Thigh, &c. where the Cramp useth to come. I do finde this the more strange, because neither of these have any Relaxing Virtue, but rather the contrary. I judge therefore that their working is rather upon the Spirits within the *Nerves* to make them strive less, then upon the Bodily substance of the *Nerves*.

I would have tryal made of two other kindes of Bracelets for comforting the Heart and Spirits. The one of the *Trochisch* of *Vipers* made into little pieces of Beads; for since they do great good inwards (especially for *Pestilent Agues*) it is like they will be effectual outwards, where they may be applied in greater quantity. There would be *Tichischs* likewise made of *Snakes*, whose flesh dried is thought to have a very opening and Cordial Virtue. The other is of Beads made of the Scarlet Powder, which they call *Kermes*, which is the principal Ingredient in their *Cordial-Confection Alkermen*. The Beads would be made up with *Amber-Griee*, and some *Pomander*.

It hath been long received, and confirmed by divers tryals, that the Root of the *Male-Peony* dried, tied to the Neck, doth help the *Falling-sicknes*; and likewise the *Incubus*, which we call the *Mare*. The cause of both these *Diseases*, and especially of the *Epilepsie* from the Stomack, is the grossness of the Vapors which rise and enter into the Cells of the Brain: And therefore the working is by extream and subtil Attenuation, which that Simple hath. I judge the like to be in *Castoreum*, *Musk*, *Ren-Seed*, *Agnus Castus Seed*, &c.

There is a Stone which they call the *Blood-Stone*, which worn is thought to be good for them that bleed at the Nose; which (no doubt) is by astricti-on and cooling of the Spirits. *Quare*, if the Stone taken out of the *Toads* Head, be not of the like virtue, for the *Toad* loveth Shade and Coolness.

Light may be taken from the *Experiment* of the *Horse-tooth Ring*, and the *Garland* of *Perwinckle*, how that those things which asswage the strife of the Spirits, do help diseases, contrary to the Intention desired; for in the curing of the Cramp, the Intention is to relax the Sinews; but the contraction of the Spirits, that they strive less, is the best help: So to procure easie *Tra-*vails of Women, the Intention is to bring down the Childe; but the help is, to stay the coming down too fast; whereunto they say the *Toad-stone* likewise helpeth. So in *Pestilent Fevers*, the Intention is to expel the Infection by Sweat and Evaporation; but the best means to do it, is by *Nitre*, *Diascordium*, and other cool things, which do for a time arrest the Expulsion, till Nature can do it more quietly. For as one saith prettily, *In the quenching of the flame of a Pestilent Ague, Nature is like People that come to quench the Fire of an House; which are sobusie, as one of them letteth another.* Surely it is an excellent Axiome, and of manifold use, that whatsoever appeaseth the contention of Spirits furthereth their action.

The Writers of *Natural Magick* commend the wearing of the spoil of a Snake, for preserving of Health. I doubt it is but a conceit; for that the Snake is thought to renew her youth by casting her spoil. They might as well take the Beak of an Eagle, or a piece of a Harts-horn, because those renew.

It hath been anciently received, (for *Pericles* the *Athenian* used it) and it is yet in use, to wear little Bladders of *Quick-silver*, or Tablets of *Arsenick*, as preservatives against the Plague: Not, as they conceive, for any comfort they yield to the Spirits; but for that being poysons themselves, they draw the venome to them from the Spirits.

965.

966.

967.

968.

969.

970.

971. *Vide the Experiments 95, 96, and 97. touching the several Sympathies and Antipathies for Medicinal use.*
972. It is said, that the Guts or Skin of a Woolf being applied to the Belly do cure the Colick. It is true, that the Woolf is a Beast of great Edacity and Digestion; and so it may be the parts of him comfort the Bowels.
973. We see *Scare-crows* are set up to keep Birds from Corn and Fruit. It is reported by some, that the Head of a Woolf, whole, dried and hanged up in a *Dove-house*, will scare away Vermin, such as are *Wrasils*, *Pole-cats*, and the like. It may be the Head of a Dog will do as much; for those Vermin with us, know Dogs better then Wolves.
974. The Brains of some Creatures, (when their Heads are rosted) taken in Wine, are said to strengthen the Memory; as the Brains of Hares, Brains of Hens, Brains of Deer, &c. And it seemeth to be incident to the Brains of those Creatures that are fearful.
975. The Oyntment that Witches use, is reported to be made of the Fat of Children digged out of their Graves; of the Juices of Smallage, Woolfbane, and Cinquefoil, mingled with the Meal of Fine Wheat. But I suppose, that the Soporiferous Medicines are likest to do it; which are Henbane, Hemlock, Mandrake, Moonshade, Tobacco, Opium, Saffron, Poplar-leaves, &c.
976. It is reported by some, that the affections of Beasts when they are in strength, do add some virtue unto inanimate things: As that the Skin of a Sheep devoured by a Woolf moveth itching; that a stone bitten by a Dog in anger, being thrown at him, drunk in Powder provoketh Cholera.
977. It hath been observed, that the diet of Women with Childe, doth work much upon the Infant. As if the Mother eat Quinces much, and Coriander-seed (the nature of both which, is to repress and stay vapors that ascend to the Brain) it will make the Childe ingenious: And on the contrary side, if the Mother eat (much) Onions or Beans, or such vaporous food, or drink Wine or strong drink immoderately, or fast much, or be given to much musing, (all which send or draw vapors to the Head) it indangereth the Childe to become Lunatick, or of imperfect memory: And I make the same judgment of Tobacco often taken by the Mother.
978. The Writers of *Natural Magick* report, that the Heart of an Ape worn near the Heart, comforteth the Heart, and increaseth audacity. It is true, that the Ape is a merry and bold Beast. And that the same Heart likewise of an Ape applied to the Neck or Head, helpeth the Wit, and is good for the Falling sickness. The Ape also is a witty Beast, and hath a dry Brain; which may be some cause of attenuation of Vapors in the Head. Yet it is said to move Dreams also. It may be the Heart of a Man would do more, but that it is more against Mens mindes to use it; except it be in such as wear the Reliques of Saints.
979. The Flesh of a Hedghog dressed and eaten, is said to be a great dryer. It is true, that the Juice of a Hedghog must needs be harsh and dry, because it putteth forth so many Prickles: For Plants also that are full of Prickles are generally dry; as Bryars, Thorns, Barberries. And therefore the ashes of a Hedghog are said to be a great desiccative of Fistula's.
980. Mummy hath great force in stanching of Blood; which as it may be ascribed to the mixture of Balms that are Glutenous, so it may also partake of a secret propriety, in that the Blood draweth Mans flesh. And it is approved, that the Moss which groweth upon the Scull of a Dead Man unburied will stanch Blood potently. And so do the dregs or powder of Blood, severed from the Water and dried.

It hath been practised to make *White Swallows*, by anointing of the Eggs with Oyl. Which effect may be produced by the stopping of the Pores of the Shell, and making the Juice that putteth forth the Feathers afterwards more penurious. And it may be, the anointing of the Eggs will be as effectual as the anointing of the Body. Of which, *Vide the Experiment 93.*

981.

It is reported, that the **White of an Egg** or **Blood mingled with Salt-water**, doth gather the saltness, and maketh the water sweeter. This may be by **Adhesion**; as in the *Sixth Experiment of Clarification*. It may be also, that **Blood, and the White of an Egg**, (which is the matter of a Living Creature) have some Sympathy with Salt; for all Life, hath a Sympathy with Salt. We see that Salt laid to a cut finger, healeth it; so, as it seemeth, Salt draweth Blood, as well as Blood draweth Salt.

982.

It hath been anciently received, that the **Sea-Hare** hath an antipathy with the **Lungs**, (if it cometh near the Body) and erodeth them. Whereof the cause is conceived to be a quality it hath of heating the Breath and Spirits; as *Cambarides* have upon the watry parts of the Body, as **Urine and Hydropical Water**. And it is a good rule, That whatsoever hath an operation upon certain kindes of Matters, that in **Mans Body** worketh most upon those parts wherein that kinde of matter aboundeth.

983.

Generally that which is **Dead, or Corrupted, or Excerned**, hath antipathy with the same thing when it is alive, and when it is sound, and with those parts which do excern: As a **Carcass of Man** is most infectious and odious to Man, a **Carrion of an Horse** to an Horse, &c. **Purulent matter of Wounds** and **Ulcers, Carbuncles, Pox, Scabs, Leprosie**, to sound Flesh; and the **Excrements of every Species** to that Creature that excerneth them. But the **Excrements** are less pernicious then the **corruptions**.

984.

It is a common experience, That **Dogs** know the **Dog-killer**, when as in times of Infection some pety fellow is sent out to kill the Dogs; and that though they have never seen him before, yet they will all come forth, and bark, and flie at him.

985?

The *Relations* touching the **Force of Imagination**, and the **Secret Instincts of Nature**, are so uncertain, as they require a great deal of Examination ere we conclude upon them. I would have it first thoroughly inquired, whether there be any secret passages of Sympathy between Persons of near Blood; as *Parents, Children, Brothers, Sisters, Nurse-children, Hubands, Wives, &c.* There be many reports in *History*, that upon the death of Persons of such nearness, Men have had an inward feeling of it. I my self remember, that being in *Paris*, and my Father dying in *London*, two or three days before my Fathers death, I had a dream, which I told to divers *English Gentlemen*, that my Fathers House in the Countrey was Plaistered all over with **Black Mortar**. There is an opinion abroad, (whether idle, or no I cannot say) That loving and kinde **Husbands** have a sense of their **Wives** breeding Childe by some accident in their own Body.

986.

Next to those that are near in Blood, there may be the like passage and instincts of Nature between great **Friends** and **Enemies**. And sometimes the revealing is unto another person, and not to the party himself. I remember *Philippus Comineus* (a grave **Writer**) reporteth, That the **Archbishop of Vienna** (a Reverend **Prelat**) said (one day) after **Mass** to King *Lewis* the Eleventh of *France*, *Sir, Your Mortal Enemy is dead*; what time, *Charles Duke of Burgundy* was slain at the Battel of *Granson* against the *Switzers*. Some tryal also would be made, whether **Paet** or **Agreement** do any thing; as if two **Friends** should agree, That such a day in every **Week**, they being in far distant places, should

987.

should pray one for another, or should put on a *Ring* or *Tablet* one for anothers sake; whether, if one of them should break their Vow and Promise, the other should have any feeling of it in absence.

988.

If there be any force in Imaginations and Affections of singular Persons, it is probable the force is much more in the Joynt-Imaginations and Affections of Multitudes; as if a victory should be won or lost in remote parts, Whether is there not some sense thereof in the people whom it concerneth, because of the great joy or grief that many men are possessed with at once? *Pius Quintus*, at the very time when that memorable victory was won by the *Christians* against the *Turks*, at the Naval Battel of *Lepanto*, being then hearing of *Caules* in the Consistory, brake off suddenly, and said to those about him, *It is now more then time we should give thanks to God for the great Victory he hath granted us against the Turks.* It is true, that Victory had a Sympathy with his Spirit, for it was meerly his work to conclude the League: It may be that *Revelation* was *Divine*. But what shall we say then to a number of Examples amongst the *Grecians* and *Romans*, where the People being in Theatres at Plays, have had news of Victories and Overthrows some few days, before any Messenger could come?

It is true, that that may hold in these things which is the general Root of Superstition; namely, that men observe when things hit, and not when they miss, and commit to Memory the one, and forget and pass over the other. But touching *Divination* and the misgiving of Mindes, we shall speak more when we handle in general the *Nature of Mindes*, and *Souls*, and *Spirits*.

989.

We having given formerly some *Rules of Imagination*, and touching the fortifying of the same; we have set down also some few Instances and Directions of the force of Imagination upon *Beasts*, *Birds*, &c. upon *Plants*, and upon *Inanimate Bodies*: Wherein you must still observe, that your Tryals be upon Subtil and Light Motions, and not the contrary; for you will sooner by Imagination bind a Bird from Singing then from Eating or Flying; and I leave it to every man to chuse *Experiments* which himself thinketh most commodious, giving now but a few Examples of every of the three kindes.

990.

Use some Imaginant (observing the *Rules* formerly prescribed) for binding of a Bird from singing, and the like of a Dog from barking. Try also the Imagination of some, whom you shall accommodate with things to fortifie it in Cock-fights, to make one Cock more hardy, and the other more cowardly. It would be tried also in flying of Hawks, or in coursing of a Deer or Hart with Grey-hounds, or in Horse-races, and the like comparative Motions; for you may sooner by Imagination, quicken or slack a motion, then raise or cease it; as it is easier to make a Dog go slower, then to make him stand still, that he may not run.

991.

In *Plants* also you may try the force of Imagination upon the lighter sort of Motions; as upon the sudden fading or lively coming up of Herbs; or upon their bending one way or other, or upon their closing and opening, &c.

992.

For *Inanimate* things, you may try the force of Imagination upon staying the working of Beer, when the Barm is put in; or upon the coming of Butter or Cheese, after the Churning, or the Rennet be put in.

993.

It is an ancient *Tradition*, every where alleaged, for example of secret Proprieties and Influxes, That the *Torpedo Marina*, if it be touched with a long stick, doth stupefie the hand of him that toucheth it. It is one degree of

working

working at distance, to work by the continuance of a fit *Medium*; as Sound will be conveyed to the Ear by striking upon a Bow-string, if the Horn of the Bow be held to the Ear.

The Writers of *Natural Magick* do attribute much to the Virtues that come from the parts of Living Creatures, so as they be taken from them, the Creatures remaining still alive; as if the Creature still living did infuse some immateriate Virtue and Vigor into the part severed. So much may be true, that any part taken from a Living Creature newly slain, may be of greater force, then if it were taken from the like Creature dying of itself; because it is fuller of Spirit.

994.

Tryal would be made of the like parts of Individuals in Plants and Living Creatures; as to cut off a Stock of a Tree, and to lay that which you cut off to putrefie, to see whether it will decay the rest of the Stock; or if you should cut off part of the Tail, or Leg of a Dog, of a Cat, and lay it to putrefie, to see whether it will fester, or keep from healing, the part which remaineth.

995.

It is received, that it helpeth to continue love, if one wear a Ring or a Bracelet of the Hair of the party beloved. But that may be by the exciting of the Imagination; and perhaps a Glove, or other like Favor, may as well do it.

996.

The Sympathy of Individuals that have been entire, or have touched, is of all others, the most incredible; yet according unto our faithful manner of Examination of Nature, we will make some little mention of it. The taking away of Warts, by rubbing them with somewhat that afterwards is put to waste and consume, is a common Experiment; and I do apprehend it the rather, because of mine own experience. I had from my Childhood a Wart upon one of my Fingers; afterwards, when I was about sixteen years old, being then at *Paris*, there grew upon both my hands a number of Warts (at least an hundred) in a months space. The *English Ambassadors Lady*, who was a Woman far from Superstition, told me one day she would help me away with my Warts. Whereupon she got a piece of Lard with the skin on, and rubbed the Warts all over with the fat side, and amongst the rest that Wart which I had from my Childhood; then she nailed the piece of Lard, with the fat towards the Sun, upon a post of her Chamber-window, which was to the South. The success was, that within five weeks space all the Warts went quite away, and that Wart which I had so long endured, for company. But at the rest I did little marvel, because they came in a short time, and might go away in a short time again; but the going of that which had staid so long doth yet stick with me. They say the like is done by rubbing of Warts with a green Elder-stick, and then burying the stick to rot in muck. It would be tried with Corns and Wens, and such other Excrecences: I would have it also tried with some parts of Living Creatures that are nearest the nature of Excrecences; as the Combs of Cocks, the Spurs of Cocks, the Horns of Beasts, &c. and I would have it tried both ways; both by rubbing those parts with Lard or Elder as before; and by cutting off some piece of those parts, and laying it to consume, to see whether it will work any effect towards the Consumption of that part which was once joyned with it.

997.

It is constantly received and avouched, that the anointing of the Weapon that maketh the Wound, will heal the Wound it self. In this Experiment, upon the relation of men of credit, (though my self, as yet, am not fully inclined to believe it) you shall note the Points following. First, the Oyntment wherewith this is done, is made of divers Ingredients; whereof the

998.

strangest

strangest and hardest to come by, are the Moss upon the Skull of a dead Man unburied, and the Fats of a Boar, and a Bear killed in the act of generation. These two last I could easily suspect to be prescribed as a startling hole, that if the *Experiments* proved not, it might be pretended, that the Beasts were not killed in the due time; for as for the Moss, it is certain there is great quantity of it in *Ireland*, upon slain Bodies laid on heaps unburied. The other Ingredients are the Blood-stone in Powder, and some other things which seem to have a virtue to stanch blood, as also the Moss hath. And the description of the whole Oynment is to be found in the *Chymical Dispensatory* of *Crollius*. Secondly, The same kinde of Oynment applied to the hurt it self, worketh not the effect, but onely applied to the weapon. Thirdly, (which I like well) they do not observe the consecrating of the Oynment under any certain Constellation; which commonly is the excuse of Magical Medicines when they fail, that they were not made under a fit figure of Heaven. Fourthly, it may be applied to the Weapon, though the party hurt be at great distance. Fifthly, it seemeth the Imagination of the party to be cured is not needful to concur, for it may be done without the knowledge of the party wounded: And thus much hath been tried, that the Oynment (for *Experiments* sake) hath been wiped off the Weapon without the knowledge of the party hurt, and presently the party hurt hath been in great rage of pain, till the weapon was reanointed. Sixthly, it is affirmed, That if you cannot get the weapon, yet if you put an Instrument of Iron or Wood, resembling the weapon into the Wound, whereby it bleedeth, the anointing of that Instrument will serve and work the effect. This I doubt should be a device to keep this strange form of Cure in request and use, because many times you cannot come by the Weapon it self. Seventhly, the Wound must be at first washed clean with White-wine, or the parties own Water, and then bound up close in fine Linnen, and no more dressing renewed till it be whole. Eighthly, the Sword it self must be wrapped up close as far as the Oynment goeth, that it take no wind. Ninthly, the Oynment, if you wipe it off from the Sword and keep it, wil serve again, and rather increase in vertue then diminish. Tenthly, it will cure in far shorter time, then Oynments of Wounds commonly do. Lastly, it will cure a Beast as well as a Man; which I like best of all the rest, because it subjecteth the matter to an easie tryal.

999.

Experiment
Solitary,
touching
Secret Propri-
eties

I Would have Men know, that though I reprehend the easie passing over of the causes of things, by ascribing them to secret and hidden virtues and proprieties (for this hath arrested and laid asleep all true Inquiry and Indications;) yet I do not understand, but that in the practical part of knowledge much will be left to Experience and Probation, whereunto Indication cannot so fully reach; and this is not onely in *Specie*, but in *Individuo*. So in Physick, if you will cure the *Faundies*, it is not enough to say, that the Medicine must not be cooling, for that will hinder the opening which the disease requireth; that it must not be hor, for that will exasperate Choler; that it must go to the Gall, for there is the obstruction which causeth the disease, &c. But you must receive from Experience, that Powder of *Chamapytis*, or the like, drunk in Beer, is good for the *Faundies*. So again, a wise Physician doth not continue still the same Medicine to a Patient, but he will vary, if the first Medicine doth not apparently succeed; for of those Remedies that are good for the *Faundies*, *Stone*, *Agues*, &c. that will do good in one Body, which will not do good in another, according to the correspondence the Medicine hath to the Individual Body.

The

THe delight which Men have in *Popularity, Fame, Honor, Submission,* and *Subjection* of other *Mens Mindes, Wills, or Affections* (although these things may be desired for other ends) seemeth to be a thing in it self; without contemplation of consequence, grateful, and agreeable to the Nature of Man. This thing (surely) is not without some signification, as if all Spirits and Souls of Men came forth out of one *Divine Limbus*; else, why be Men so much affected with that which others think or say? The best temper of Mindes, desireth good Name and true Honor; the lighter, Popularity and Applause; the more depraved, Subjection and Tyranny; as is seen in great Conquerors and Troublers of the World; and yet more in Arch-Heretics, for the introducing of new Doctrines; is likewise an affectation of Tyranny over the Understandings and Beliefs of Men.

1000.
Experiment
Solitary,
touching the
General Sym-
pathy of Mens
Spirits.

A

The first part of the book is devoted to a general
 description of the country, its climate, soil, and
 productions. The author then proceeds to a
 detailed account of the principal cities and
 towns, and the manner in which they are
 governed. He also describes the various
 trades and manufactures, and the state of
 agriculture. The second part of the book
 contains a history of the country, from the
 earliest times to the present. The author
 relates the various revolutions, wars, and
 events which have happened, and the
 progress of the country towards
 civilization and improvement. The third
 part of the book is a collection of
 laws, customs, and manners, which
 are peculiar to the country. The fourth
 part is a collection of poems, songs, and
 other pieces of literature, which are
 the property of the country. The fifth
 part is a collection of maps, charts, and
 other diagrams, which are necessary to
 illustrate the history and geography of
 the country. The sixth part is a
 collection of tables, which contain
 various statistics and facts, which are
 useful to the reader. The seventh part
 is a collection of notes, which contain
 various observations and remarks, which
 are useful to the reader. The eighth
 part is a collection of indexes, which
 contain the names of the various
 subjects, which are treated in the book.

 Clarification of Liquors, 67. Three causes thereof, ibid. 80. Clarification of them by Separation, ibid. By even distribution of the Spirits, ibid. By Refining the Spirit, ibid. Several instances of Clarification, ibid. 68. Clarification of Drinks,

ibid. 69. Of Wine 137
 Clarification 162
 Cloves, attractive of water 21
 coasting of Plants 99
 Coffee, a Berry making Drink in Turkey 153
 Cold, 19. Production of it; a very noble work, ibid. Seven means to produce it, ibid. 20. Primum Frigidum, the Earth, 19. Transitive into Bodies adjacent, as well as Heat, ibid. All tangible bodies of themselves, cold, ibid. Density, cause of cold, ibid. Quick spirit in a cold body, increaseth cold, ibid. 20. Chasing away of the warm spirits, increase of cold, ib. Exhaling of the warm spirits, doth the like, ibid. Cold prohibiteth Putrefaction, 75. Irritateth Flame 83
 Cold having mortified any part, how to help it 166
 Coleworts furthered in their growth by Seaweed, 96. By being watered with Salt-water, 98. Hurt Neighbor Plants 101
 Colick cured by application of woofs-guts 210
 Colligation 73
 Coloquintida 202
 Coloration of Flowers, 108. Colours of Flowers different from the same Seed, 109. Colours of Herbs. ibid.
 Colours vanish not by degrees, as Sounds do, 51. The causes thereof, ibid. Colours of Metal Orient in their dissolutions, 64. The causes. ibid.
 Comforting of the Spirits of Men by several things 209
 Composts to enrich ground, 122, 123, 124. The ordering of them for several grounds, 222. Six kinds of them. ibid.
 Compound fruits, 100. How they may be made. ibid.
 compression in solid bodies, 2. Cause of all violent motion, 3. Not hitherto inquired, ibid. worketh first in round, then in progress, ibid. Easily discernable in Liquors, in solid bodies not, ibid. Compression in a brittle body, ibid. In Powder, in Shot, ibid. To a preternatural extent, 16. In Sounds, ib. Compression of Liquors 187
 Concoction, 179. The word less restrained then formerly, ibid. Not the work of Heat alone, ibid. The two periods of it. ibid.
 Concords in Musick 30
 Concretion of Bodies, 181. Dissolved by the contrary. ibid.
 Condensing Medicines to relieve the Spirits 155
 Condensing of Air into weight 156
 Con-

A Table of the chief Matters

Congeaing of Air	80
Conservation of Bodies long time, 162, 163.	
The causes and helps thereof	ibid.
Conservation of Bodies in Quick-silver	168
Consistence of Bodies	180
Consumptions in what Airs recovered	204
Contiguous things their operations	201
Coppice-woods hastued	93
Coral	126, 165
No Core in Fruits	110
Corn changed by sowing often in the same ground, 111. Changed into a baser kinde by the sterility of the year, ibid. The Diseases thereof, 136. The remedy of the Diseases, ibid. 137. Choice of the best Corn	ibid.
Corruptions	73
Court of Vulcan, near Puteoli	165
Cramp, 211, 212. Two cures of it	ibid.
Creatures moving after the severing of the head, 88. The causes thereof	ibid.
Crudity	179
Crystal in Caves, 81. Designation of a tryal for making of it	ibid.
Cucumbers made to grow sooner, 96. To bear two years, ibid. By steeping their Seeds in Milk, prove more dainty, 98. Made more delicate by throwing in chaff when they are set, ibid. They exceedingly affect moisture, ibid. Will grow towards a pot of water.	ibid.
Cure by custom, 17. Caution to be used in diseases counted incurable, ibid. cure by excess, ibid. The cause of it, ibid. Cure by motion of consent, ibid. Physicians, how to make use of this motion	ibid.
Curiosities touching Plants, 107, 108, 109,	110
Curled leaves in Plants	133
Cutting Trees often, causeth their long lasting	120
Cuttles blood	156

D.

D amps from Mines and Minerals	202
Day showers, not so good for Fruits as night-showers	135
Death without pain	232
Decoction maketh Liquors clearer, Infusion thicker, 68. The cause	ibid.
Deer, 159. Their generatig	ibid.
Degenerating of Plants, 110, 111. The several causes thereof	ibid.
Democritus	203
Desiccation	74
Dew upon Hills, better then upon Valleys	165
Diamonds Cornish	2
Diapason, the sweetest of Sounds, 30. The	

Diapason or number of Eight, rather a thing received, then a true computation,	ibid.
Half Notes of Necessity between the Unison and Diapason	ibid.
Diet-drinks, 19. Most troublesome at first	ibid.
Differences of Plants	121, 122
Differences of several passions in matter	182
Digging of the Earth healthful	203
Discords in Musick	30, 31
Diseases contrary to predisposition, 17. What the Physician is to do in such cases, ibid.	
Diseases infectious, 65. Diseases epidemical	85
Displeasures and pleasures of the senses	145
Displeasure light, 151. The impressions thereof	ibid.
Dissolution of Iron in Aqua-fortis	166
Divination Natural	172
Dogs know the Dog-killer	211
Double flowers	109, 110
Down upon the leaves of Plants, 117. The virtue of such leaves	ibid.
Dreams pleasant and propheticall procured by some smells	204
Drinks, 69. The maturation of them, ibid. How it is wrought, ibid. Wherein it differeth from clarification, ibid. Degrees of Maturation in several Liquors, ibid. Maturation by enforcing the motions of the Spirits, ibid. Quickning of drinks that is dead	ibid.
Drowning of Metals	168, 169
Drunken men, 152. Their Sperm unfruitful, 153. They are unapt for voluntary motion, ibid. Imagine false things as to the eye, ibid. Distempered sooner with small draughts, then with great	ibid.
Drying the adventitious moisture, prohibiteth putrefaction, 76. Mixture of dry things prohibits it	ibid.
Ductible Bodies	181, 182
Dalcoration of things, 132. Of Metals, 79. Of Fruits by several ways, 186. The causes of them	ibid.
Dungs of Beasts to enrich grounds, 122. Which of them the best	ibid.
Dust maketh Trees fruitful	136
Dwarfing of Trees	113

E.

E Ar dangerous to be picked in yawning	140
Early Flowers and Plants	119
Earth and Sand differ, 1. Earth Primum rigidum, 19. Infusions in Earth, 83. The effects thereof, ibid. Cautions to be used therein, ibid. Several instances thereof,	ibid.

contained in these Centuries.

ibid. Earth taken out of the Vaults will put forth Herbs, 117. The nature of those Herbs, *ibid.* what Earth taken out of shady and watry woods will put forth, *ibid.* Earth upon Earth, a good Compost, 123. Earths good and bad, 136. Earths Medicinal, 147. Earth taken near the River Nilus, 156. Earth pure, the healthfulest smell of all 203
 Ebbing and Flowing of the Sea 200
 Ecchoes, 56. Artificial Ecchoes not known, *ibid.* Natural Ecchoes where found, *ibid.* The differences between the Concurrent Eccho and Iterant, *ibid.* No Eccho from a Trunck, stopped at one end, *ibid.* The cause, *ibid.* Eccho from within a Well, *ibid.* whether Ecchoes move in the same angle with the original Sounds, *ibid.* Plurality of Ecchoes in one place, *ibid.* Back-ecchoes, *ibid.* Ecchoes returning many words, 58. Eccho upon Eccho, 167, 168. The like betwixt an House, and an Hill, 58. Eccho will not return the Letter S, *ibid.* Difference of Ecchoes, *ibid.* Mixture of Ecchoes *ibid.*
 Edible flesh, and not Edible, 186. The causes of each *ibid.*
 Eggs, the yolks of them great nourishers, 14. How to be used, *ibid.* Yolk conduceth more to the nourishment. white to the generation of the Bird 25
 Eight, the sweetest Concord in Musick 30
 Elder stick put to consume, taketh away warts 213
 Elestrum 168
 Electric Bodies *ibid.*
 Elm grafted 100
 Enforcing a thought upon another, 204. Instance thereof, in a Jugglers trick, *ibid.* Three means by which it must be wrought 204, 205
 Englishman hurt in the Leg, hard to cure 166
 Envy 203, 204
 Epidemical Diseases 85
 Esculent Plants, 129. Esculent raw, *ibid.* Having passed the fire, *ibid.* Not Esculent at all *ibid.*
 Eunuchs 142
 Excrements of living creatures smell ill, 177. The cause, 178. Some smell well; *ibid.* The cause, *ibid.* Most odious to a creature of the same kinde
 Excrescences of Plants, 113, 114, &c. Two tryals for Excrescences, 116. Excrescences joyned with Putrefaction 117
 Exercise, 66. In what Bodies hurtful, *ibid.* Not to be used with a spare diet, *ibid.* Benefits of exercise, *ibid.* Evils of exer-

cise, *ibid.* Exercise impinguateth not so much as frictions, 190. The cause *ibid.*
 Eye of the Understanding, like the Eye of Sense 24
 The Eyes, 188. Both move one way, *ibid.* See better one eye shut, *ibid.* The cause, *ibid.* why some see one thing double, *ibid.* Pore-blinde men see best near-hand, *ibid.* The cause, *ibid.* Old men at some distance *ibid.*
 Eyes are offended by over-great Light, 189. By enterchange of Light and Darknes upon the sudden, *ibid.* By small Prints, *ibid.* wax red in Anger, in Blushing not; *ibid.* The cause of each, *ibid.* Eye re-placed, hath recovered sight 88

F.

Fable of Hercules and Hylas 40
 Falling-sickness, how helped 210
 Fascination 203
 Fat extracted out of flesh 139
 Fear, 149, 206. The impressions thereof 149, 150
 Feathers of Birds, why of such fine colours, 2. How the colour of them may be changed, 24, 25. Age changeth them 183
 Feathers burnt, suppress the Mother 204
 Female and Male in Plants, 126. The differences of Female and Male in several living creatures, 184. The causes thereof *ibid.*
 Fetid smells 177, 178
 Fibrous Bodies 181, 182
 Figs in the Spring, 96. Indian Fig 127
 Figurable, and not Figurable 182
 Figures of Plants 121
 Figures or Tropes in Musick, have an agreement with the Figures of Rhetoric 31
 Fire Tanneth not as the Sun doth 87, 88
 Fire and hot water, heat differently, 140. Fires subterrany 80
 Fire and Air foreshew winds 174
 Fish of the Sea, put into fresh water 147, 148
 Fishes foreshew rain 175
 Fishes greater then any Beasts, 184. The cause *ibid.*
 Fixation of Bodies 169
 Flame and Air mix not, 8. Except in the Spirits of Vegetables, *ibid.* And of living creatures, *ibid.* Their wonderful effects mixed, 9. Form of Flame would be Globular, and not Pyramidal, *ibid.* Would be a lasting Body, if not extinguished by Air, *ibid.* Mixeth not with Flame, *ibid.* Burns stronger on the sides, then in the midst, *ibid.* Is irritated by the Air ambient, *ibid.* Opinion of the Peripateticks

A Table of the chief Matters

of the Element of Fire, *ibid.* Preyeth upon Oil, as Air upon Water, 24. Taketh in no other body into it, but converteth it, 169. Flame causing water to rise, 192. Flame, 81. The continuance of it according to several Bodies, *ibid.* Observation about going out of Flame, *ibid.* 82. Lasting thereof, in Candles of several mixtures, *ibid.* Of several Wicks, *ibid.* 83. In Candles laid in Brar, *ibid.* In Lamps, *ibid.* Where it draweth the nourishment far, *ibid.* In a Turretted Lamp, *ibid.* Where it is kept close from Air, 83. According to the temper of the Air, *ibid.* 84. Irritated by cold *ibid.*

Flesh dissolved into Fat, 139. Flesh edible and not edible, 186. The causes of each, *ibid.* Horses flesh sometimes eaten, *ibid.* Mans flesh likewise, *ib.* Eaten by Witches *ib.*

Flies in excess, sign of a Pestilential year, 155. The cause *ibid.*

Flight of Birds, the swiftest motion, 139. The cause thereof *ibid.*

Flint laid at the bottom of a Tree, hath helped the growth, 93. The cause *ibid.*

Flowers smell best whose Leaves smell not, 86. Flowers growing amongst the Corn, and no where else, 108. To have Flowers grow upon Trees, 102. To induce colour into Flowers, *ibid.* Flowers double, 109. To make them so in fruitful Trees, *ibid.* Flowers, 121. All exquisitely figured, *ibid.* Numbers of their Leaves *ibid.*

Flying in the Air of a Body unequal, 167. Of a Body supported with Feathers 191

Forming of parts in young Creatures 7

Foreign Plants 118, 119

Fowls, Water-fowls foreshew Rain 175

Fragile Bodies, 180. The cause of their fragility *ibid.*

French-man hurt in the head, hard to cure 166

Fryer Bacons Illusion 160

Friction, a furtherer of nourishment, 16. Maketh the parts more freshly, 190. The cause, *ibid.* Impinguateth more then Exercise, *ibid.* The cause *ibid.*

Frogs in excess, a sign of a pestilential year, 155. The cause *ibid.*

Fruits, their maturation, 70. The causes thereof, *ibid.* Several instances thereof, *ibid.* 71. The dulcoration thereof, by other means, 186. The several causes it.

Fruit pricked as it groweth, ripens sooner, 96. Fruit-tree grafted upon a wild tree, 97. Fruit dulcorated, by applying of Swines dung, 98. The cause, *ibid.* Also by Cheff and Swines dung mingled, *ibid.* Enlarged by being covered with a Pot as it groweth,

ibid. Fruits compound, 100, 101. Fruits of divers kindes upon one Tree, 107. Fruits of divers shapes and figures, *ibid.* 108. Fruits with inscriptions upon them, *ibid.* Fruits that are red within, 109. Fruits coming twice a year, 119. Fruits made without core or stone, 110. Fruits that have juices fit for drink, 130. Unfit, *ibid.* The cause of each, *ibid.* Fruits sweet before they be ripe, 132. which never sweeten, *ibid.* Fruit blossoming, hurt by South-winds 135

Fuel not consuming, 163, 164. Fuel consuming fast, *ibid.* Fuel cheap *ibid.*

Full of the Moon, 193. Several effects of it, *ibid.* Tryals for further observations 194

Fumes taken in Pipes 202

March, towards the end, the best discoverer of Summer sicknesses 173

Marl, a good Compost 122, 123

Marrow 157, 158

Maturation, 179. Of Drinks, 69, 70. Of Fruits, ibid. Maturation of Digestion, 71, 73

Meats inducing satiety 66

Medicines changed helpful, 18. Medicines which effect the Bladder, 25. Medicines condensing, which relieve the Spirits, 155. Medicinal Herbs 104, 105

Megrims come upon rising, not during the sitting 154

Melancholly persons dispose the company to the like 26

Melioration of Fruits, Trees, and Plants, 93, 94, 95, 96, 97, 98, 99, 100

Melc-cotones grow best without grafting, 97. The cause thereof ibid.

Memory the Art, 207. Men, better places than words, ibid. Memory strengthened by the Brains of some creatures 210

Menstruous women 202

Mercurial and Sulphurous 78

Metals and Plants wherein they differ, 126. Growing of metals, 168. Drowning of metals, ibid. 169. Refining of metals, 183. Metalline Vapors hurtful to the Brain, 202. Metals give orient colours in their dissolutions, 64. The causes ibid.

Milk warm from the Cow, a great nourisher, 14. How to be used, ibid. Cows Milk better then Asses Milk, or then womens Milk, ibid. Milk in Beasts, how to be increased, 164. Milk used for Clarification of Liquors, 69. Good to steep divers Seeds in, 98. Preserving of Milk, 85. Milk in Plants 131

Mildew 104, 136

Minced meat, a great nourisher, 14. How to be used ibid.

Mistletoe 116

Mixture of Earth and water in Plants 79

Moist Air, how discovered 173

Moisture adventitious, cause of putrefaction, 68. Moisture qualifying heat, the effect, 140. Moisture increased by the Moon, 193. Tryal of it in Seeds, ibid. in mens bodies, ibid. Force of it in Vegetables 103, 104

Monsters 100

Moon attractive of heat out of Bodies 20

Moones influences, 192, 193, 194. In number four, ibid. It increaseth moisture ibid.

Morsus Diaboli, an Herb 134

Mortified parts by cold, 166. Must not approach the fire, ibid. Cured, by applying Snow, ibid. Or warm water ibid.

Moss, 75, 113. where it groweth most, ibid. The cause of it, ibid. what it is, ibid. Moss sweet, 114. In Apple-trees sweet, ibid. In some other Trees 132

Mother suppressed by burning Feathers 204

Mothers diet affecteth the Infant in the womb 210

Motion hindreth putrefactions 75

Motion of Bodies, 161. Motion of Liberty 3

Motion of Nexe, 192. Motion of Consent in mans body, 10, 17. Motion of Attraction would prevail if Motion of Gravity hindered not 148

Motions in men by imitation 65

Moulding of Fruits 108

Moulds 75

Mountains great foreshew Tempests early 174

Mouth out of taste, 141. what tastes it will not have ibid.

Mulberry-leaf 161

Mummy stancheth Blood 210

Murdered body, bleeding at the approach of the murdherer 207

Mulcovia

A Table of the chief Matters

Muscovia hath a late Spring, and early Harvest, 119. The cause ibid.
 Mushrooms, 115. Their proprieties, ibid.
 Several productions of them, ibid. where they grow most 131
 Musick, 29. Musical and Immusical sounds, ibid. Bodies producing Musical sounds, ibid. 30. Diapason the sweetest of sounds, ibid. Fall of Half-notes necessary in Musick, ibid. Consent of Notes to be ascribed to the Ante-notes, not Entire Notes, 30. Concords Perfect, and Semi-perfect, which they are, ibid. The most odious Discords of all other, ibid. Discords of the Base, most disturbeth the Musick, ibid. 31. No Quarter-notes in Musick, ibid. Pleasing of single Tones, answereth to the pleasing of Colour, and of Harmony to the pleasing of Order, ibid. Figures or Tropes in Musick have an agreement with the Figures in Rhetorick, ibid. Musick hath great operation upon the manners and spirits of Men, ibid. 31, 32. Concords and Discords in Musick, are Sympathies and Antipathies of Sounds, 61. Instruments that agree best in Consort, ibid. Instruments with a double Lay of Strings, VVire, and Lute-strings 62

N.

Nature, 63. Advice for the true inquisition thereof ibid. 64
 Natural Divination 172
 Negroes 88
 Night-showres better for Fruit, then Day showres 135, 136
 Nights Star-light, or Moon-shine, colder then cloudy 188
 Nilus, the virtues thereof, 161. How to clarify the water of it ibid.
 Nitre, good for men grown, ill for children, 78. Nitrous water, 80. Scoureth of it self, ibid. Nitre mingled with water, maketh Vines sprout, 96. Nitre upon the Sea-sands 163
 Nourishing Meats and Drinks 12, 13
 Nourishing parts in Plants 14, 130
 Nourishment, 14. Five several Means to help it ibid. 15, 16
 Nourishment mended, a great help 95
 Numa's two Cousins 163

O.

Oak leaves gather Honey dews 104
 Oak-boughs put into the Earth, bring

forth wilde Vines. 111. Oak-apples 117
 Oak bears the most fruit among Trees, 157, 158. The cause ibid.
 Objects of the sight, cause great delight in the Spirits, but no great essence, 189. The cause ibid.
 Occhus, a Tree in Hyrcania 127
 Odious objects, cause the spirits to stie 167
 Odors in some degree, nourish 204
 Oyntment used by VVitches 210
 Old Trees bearing better then the same new 131
 Old men conversing with young company, live long 203
 Onions made to wax greater, 97. In growing, carry the seeds to the top 193
 Operations of Sympathy 200
 Opium 20
 Order in curing of diseases 16, 17
 Orange-flowers infused, 4. Orange-seeds sown in April, will bring forth an excellent Sallet. herb 119
 Orris-root 187
 Ox-horn bringeth forth Ivy 115
 Oily substances and watry, 76. Commixture of oily substances, prohibiteth putrefaction, ibid. Turning of watry substances into oily, 79. A great work in Nature, ibid. Some instances thereof ibid.
 Oyl of sweet-Almonds, a great nourisher, 14. How to be used ibid.

P.

Palliation in Diseases 17
 Pain and grief, 150. The impressions thereof ibid.
 Paintings of the Body, 155. Barbarous people much given to it 156, ibid.
 Panicum 95
 Pantomimi 56
 Paper chamoletted 156
 Paracellus's Principles 78, 79
 Parents finding an alteration upon the approach of their children, though unknown to them 204
 Parts in living creatures easily reparable, and parts hardly reparable, 16. Parts of living creatures severed, 216. Their virtues in Natural Magick ibid.
 Passions of the minde, 150, 151, 152. Their several impressions ibid.
 Peaches prove best without grafting, 97. The cause thereof ibid. 110
 Pearl, said to recover the colour by burial in the Earth 84
Pepper

contained in these Centuries.

Pepper-Guinny, causeth sneezing	202	Prickles of Trees, 116. Plants growing without seed, 117, 118. Growing out of stone, <i>ibid.</i> Plants foreign, <i>ibid.</i> 119. Removed out of hot Countreys will keep their seasons, <i>ibid.</i> Set in the Summer seasons will prosper in colder Countreys, <i>ibid.</i> Seasons of several Plants, <i>ibid.</i> Plants bearing blossoms, and young fruit, and ripe fruits together, 119, 120. Plants with joints or knuckles in the stalks, 121. The causes thereof, <i>ibid.</i> Differences of Plants, <i>ibid.</i> 122. Some putting forth blossoms before leaves, 121. Others, leaves before blossoms, <i>ibid.</i> The cause of each, <i>ibid.</i> Plants green all winter, 121, 122. The cause, <i>ibid.</i> Plants not supporting themselves, <i>ib.</i> The cause of their slenderness, <i>ibid.</i> Plants and inanimate bodies differ in four things, 125, 126. Plants and Metals in three, <i>ibid.</i> Plants and Moulds, or Putrefactions, wherein they differ, <i>ibid.</i> Plants and living Creatures their differences, 126, 127. Male and Female in Plants, <i>ibid.</i> Plants whereof Garments are made, 128. Plant sleeping, <i>ibid.</i> Plants with bearded Roots, <i>ibid.</i> Plants esculent, 129, 130. Esculent raw, <i>ibid.</i> Having passed the fire, <i>ibid.</i> Parts in Plants that are no wishing, <i>ibid.</i> Seeds in Plants, more strong then either Leaf or Root, <i>ibid.</i> The cause, <i>ibid.</i> In some not, <i>ibid.</i> Plants with Milk in them, 131. Plants with red juyce, 132. No Plants have a salt taste, <i>ibid.</i> Plants with curled Leaves, 133. Plants may be translated into other Regions, 135. Yet they like some soils, more then other, <i>ibid.</i> Several instances thereof, <i>ibid.</i> Plant without leaves, 162. Singularities in several Plants	
Perception in all bodies, 171. More subtil then the sense, <i>ibid.</i> It worketh also at distance, <i>ibid.</i> The best means of prognosticating	<i>ibid.</i> 172	Plaster hardned like Marble	165
Percolation, inward and outward	1, 2	Plastered room green, dangerous	202
Percussion and impulsion of bodies	160, 161	Places of Metals assuage swelling	187
Perfumes Dryers, and Perfumes Moistners of the Brain, and Perfumes procure pleasant and propheticall Dreams	204	Pleasures and displeasures of the Senses	145
Persons near in blood, or other Relations, have many secret passages of sympathy	211	Plough followed, healthful	103
Pestilential years, 85. Their prognosticks	155, 172, 173	Plumosity in Birds, 139. The cause thereof	<i>ibid.</i>
Philosophy received	178	Plums of what colour the best, 109. The dryer, the better sort	<i>ibid.</i>
Pilosity in Men and Beasts, 139. The causes thereof	<i>ibid.</i>	Pneumatics in Bodies	181
Pistachoes	13	Pomanders	203
Pit upon the Sea-shore, 1. Filled with water potable, <i>ibid.</i> Practised in Alexandria, <i>ibid.</i> And by Cesar, <i>ibid.</i> who mistook the cause, <i>ibid.</i> In time will become Salt again	191	Pont-Charenton, the Echo there	57
Pity, 151. The impressions thereof	<i>ibid.</i>	Fore-blinde men see best near hand, 188. The cause	<i>ibid.</i>
Pius Quintus his revelation, touching the victory at Lepanto	212	Potado. roots potted, grow greater	90
Plague transmitted without sent, 200, 201. The supposed sent of it, <i>ibid.</i> Persons least apt to take it, and persons most, <i>ibid.</i> Plagues caused by great putrefactions, 202. Preservatives against it	209	Powder in Shot	3
Plane-tree watered with wine	128	Powders and Liquors, their Incorporation	65
Plants, why of greater age then living creatures, 15, 16. Dignity of Plants, 89. Acceleration of their Germination, <i>ibid.</i> 90, 91, 92. Retarding of their Germination, <i>ibid.</i> The Melioration of them divers ways, 93, 94, 95, 96, 97, 98, 99, 100. Cause why some die in Winter, 96. Sympathy and Antipathy of Plants, 101, 102, 103, 104. Plants drawing the same juyces out of the earth, thrive not together, 101. Drawers of much nourishment, hurt their neighbor-plants, <i>ibid.</i> Drawing several juyces, thrive well together, 102. Several instances of each, <i>ibid.</i> Designations of further tryals hereof, <i>ibid.</i> Tryals in Herbs, poisonous or purgative, 103. Plants that die placed together, <i>ibid.</i> Tryal whether Plants will attract water at some distance, 104. Curiosities touching Plants, 107, 108, 109, 110. Plants will degenerate, 110, 111. The several causes thereof, <i>ibid.</i> Transmutation of Plants, <i>ibid.</i> Six designations thereof, <i>ibid.</i> 112, 113. Their several excrescences, 113, 114, 115, 116, 117.	128		

A Table of the chief Matters

Poysoning of air	201
Poysoning by Smells, <i>ibid.</i> 202. Caution touching poysoning	ib.
Poysonous Creatures love to lie under Odo- rate Herbs	138
Precious stones comfort the spirits	208
Preservation of bodies from corruption	28
Preservation of Fruits in Sirrups, 129. Also in powders, <i>ibid.</i> when to gather fruits for preservation, <i>ibid.</i> Also in Bottles in a well, <i>ib.</i> Preserving Grapes long, <i>ib.</i> Another way thereof	134
Prickles of Trees	116, 117
Procreations by copulation, and by putre- faction, 194. The cause of each	<i>ibid.</i> 195
Prognosticks for plenty or scarcity, 138. Of pestilential years, 141, 155, 172, 173. Of cold and long winters, 174. By Birds, 175. Of an hot and dry summer, <i>ib.</i> By the Birds also, <i>ib.</i> Of winds, <i>ib.</i> Of great tempests, <i>ib.</i> Of rain, <i>ib.</i> From living creatures, <i>ibid.</i> From water fowls and land fowls, 176. From fishes, <i>ibid.</i> From beasts, <i>ib.</i> From herbs, <i>ibid.</i> From aches in mens bodies, <i>ibid.</i> From worms, <i>ibid.</i> From the sweating of solid bodies	<i>ibid.</i>
Proprieties secret	117, 214
Purging Medicines, 5. Have their virtue in a fine spirit. Endure not boiling, <i>ibid.</i> Taking away their unpleasant taste, <i>ibid.</i> Several ways of the operations of purg- ing Medicines, 10, 11, 12. They work upon their proper Humors, 11. Medi- cines that purge by stool, and that purge by urine, 12. Their several causes, <i>ibid.</i> work in these ways as they are given in quantity, <i>ib.</i> Preparations before purg- ing, 18. Want of preparatives, what hurt it doth, both in purging, <i>ibid.</i> and after purging	<i>ibid.</i>
Putrefaction, 73. Acceleration of it, <i>ibid.</i> The cause of putrefaction, <i>ibid.</i> Putre- faction, whence, 74. Ten means of in- ducing putrefactions, <i>ibid.</i> Prohibiting of putrefaction, 75. Ten means of pro- hibiting it, <i>ibid.</i> 76. Inceptions of pu- trification, 79. Putrefactions for the most part smell ill, 177. The cause, <i>ibid.</i> Putrefaction from what causes it com- eth, 178. Putrefaction induced by the Moon-beams	192
Putrefactions of living creatures, have caused Plagues	102
Putrefied bodies most odious to a creature of the same kinde	<i>ibid.</i>
Pyrrhus had his Teeth undivided	158
Pythagoras his Philosophy	197

Q

Quarries that grow hard	183
Quick-silver will conserve Bodies	168
Quick-silver fixed to the hardness of Lead	182

R

Racking of Wine or Beer	68
Rain in Egypt scarce, 161. The cause thereof, <i>ibid.</i> Several prognosticks of Rain	175, 176
Rainbow said to bring sweetness of odor to Plants under it	176, 177
Rams skins good to be applied to wounds	139
Red within some few fruits	109
Red juyce in Plants	132
Reeds	134
Refining of Metals	183
Refraction causeth the species visible to appear bigger, 160. Other observations about Refractions	<i>ibid.</i>
Repletion hindreth Generation	94
Rest causeth Putrefaction	75
Retardation of Germination	92
Rew helpeth the Fig-tree	102
Rheumes, how caused	11
Rice a nourishing meat	13
Right-side and left, 190. Senses alike strong on both sides, Limbs strongest on the Right, <i>ibid.</i> The cause of each	<i>ibid.</i>
Rooms built for health	20
Roots of fruit trees multiplied, 93, 94. Root made great, 95. By applying Pani- cum about it, <i>ibid.</i> Roots potted, grow greater, 99, 100. Roots preserved all winter, <i>ibid.</i> Roots of Trees that descend deep, 133, 134. Others that spread more, <i>ibid.</i> The cause of each, <i>ibid.</i> Roots of Plants of three sorts. Bulbous, Fibrous, Hirsute	128
Rosa Solis the Herb	104
Roses Damask how conserved	81
Rubarb infused, 4, 5. For a short time best, <i>ibid.</i> Repeated may be as strong as Scam- mony, <i>ibid.</i> A Benedict Medicine, 5. Caution in the taking thereof	11
Rust of Metals	74

S

Satiety in Meats	66
Salamander, 186, 187. The cause that it endureth the fire	<i>ib.</i>
Salt a good Compost, 133. Salt in Plants, 132.	Salt

contained in these Centuries.

<i>Salt hath a sympathy with Blood,</i> 211. <i>It is an healer, ibid. It riseth not in Distillations</i> 190, 191	<i>Shining wood</i> 77, 78
<i>Salt-petre, how it may be bred</i> 123	<i>Showres good for fruits,</i> 135. <i>For some not, ibid. Night-showres better then Day-showres</i> 126
<i>Salt-water passed through Earth, becomes fresh,</i> 1. <i>Four differences between the passing it in Vessels and in Pits,</i> 2. <i>Salt-water good for to water some Herbs,</i> 137, 138. <i>Salt-water boiled, becomes more potable,</i> 190, 191. <i>Salt-water sooner dissolving Salt, then Fresh-water, ibid. The cause</i> ibid.	<i>Showres after a long drought, cause sicknesses if they be gentle,</i> 172. <i>If great, not</i> ibid.
<i>Sand turning Minerals into a Glassy substance</i> 164	<i>Sicknesses of the Summer and the winter</i> 84
<i>Sanguis Draconis, the Tree that bears it</i> 132	<i>Sight the object thereof, quicker then of Hearing,</i> 50, 51. <i>Sight,</i> 188, 189. <i>Objects thereof, cause great delight in the Spirits, but no great offence, ibid. The cause</i> ibid.
<i>Sap of Trees,</i> 134. <i>The differing nature thereof in several Trees</i> ibid.	<i>Silver more easily made then Gold</i> 71, 72
<i>Scarlet-dye</i> 191, 192	<i>Simples special for Medicines,</i> 141, 142. <i>Such as have subtile parts without Acrimony, ibid. Many creatures bred of Putrefaction, are so, ibid. Also Putrefactions of Plants</i> ibid.
<i>Sciissible, and not sciissible</i> 182	<i>Singularities in several Plants</i> 138
<i>Sea clearer the North-wind blowing, then the South,</i> 139. <i>Sea, by the bubbles fore-sheweth wind,</i> 175. <i>Sea-water looketh black, moved; white, resting,</i> 139. <i>The cause, ibid. Seas shallow and narrow, break more then deep and large</i> 190	<i>Sinking of Bodies,</i> 163. <i>The cause</i> ibid.
<i>Sea-fish put into Fresh-waters</i> 147	<i>Sitting healthful</i> 154
<i>Sea-hare coming near the Body, hurteth the Lungs</i> 211	<i>Skull</i> 157
<i>Sea-sand a good Compost,</i> 123. <i>Sea-sands produce no Plant</i> 118	<i>Sleep a great nourisher,</i> 15. <i>Sleep,</i> 156, 157. <i>Hindred by cold in the Feet, ibid. Furthered by some kinds of noises, ibid. Nourished in many Beasts and Birds, ibid.</i>
<i>Seasons of Plants</i> 119	<i>Sleeping creatures all winter</i> 194
<i>Secret proprieties</i> 214, 215	<i>Sleeping Plants</i> 128
<i>Secundine</i> 154	<i>Smells and Odors,</i> 86. <i>Best at some distance, ibid. Best where the Body is crushed, ibid. Not so in Flowers crushed, ibid. Best in Flowers, whose Leaves smell not, ibid. Smells sweet,</i> 177. <i>Have all a corporeal substance, ibid. Smells fetide, ibid.</i> 178. <i>Smell of the Faol most pernicious,</i> 201. <i>Smells that are most dangerous</i> ibid.
<i>Seeds in Plants, more strong then either Leaf or Root,</i> 120. <i>The cause, ibid. In some not, ibid. Seeds, their choice,</i> 137. <i>Plants growing without Seeds</i> 117, 118	<i>Snake-skin worn</i> 209
<i>Senses, their pleasures and displeasures,</i> 145. <i>Their instruments have a similitude with that which giveth the reflexion of the object</i> 62	<i>Sneezing ceaseth the Hiccough,</i> 104. <i>Induced by looking against the Sun, ibid. The cause thereof</i> ibid.
<i>Separation of several Natures by straining,</i> 2. <i>Of several Liquors by weight,</i> 3. <i>And of the same kind of Liquors thickned,</i> 4. <i>Of Metals</i> 169	<i>Snow-water,</i> 87. <i>Snows cause fruitfulness, ibid. Three causes thereof, ibid. Snow good to be applied to a mortified part,</i> 166. <i>The cause thereof, ibid. Snow bringing forth Herbs</i> 118
<i>Separation of the cruder parts prohibiteth Putrefaction</i> 76	<i>Soals of the Feet, have a sympathy with the Head</i> 25
<i>Servets used in Turkey</i> 148	<i>Soft Bodies,</i> 181. <i>The cause, ibid. They are of two sorts</i> ibid.
<i>Setting of Wheat</i> 95, 96	<i>Solid Bodies sweating foreshew Rain</i> 176
<i>Setting of Trees, higher or lower</i> 99	<i>Soot a good Compost</i> 123
<i>Several Fruits upon one Tree</i> 107	<i>Sorel,</i> 137. <i>The Root thereof</i> ibid.
<i>Shade helpeth some Plants</i> 95	<i>Soul of the World</i> 197, 198
<i>Shadows seeming ever to tremble</i> 190	<i>Sounds Musical and Immusical</i> 29
<i>Shame,</i> 151, 206. <i>The impressions thereof</i> 151	<i>Sounds more apt to procure sleep then tones,</i> 31. <i>The cause, ibid. Nature of Sounds, not sufficiently inquired,</i> 32. <i>Motions great in Nature without Sounds, ibid.</i>
<i>Shell-fish have no Bones within</i> 157, 189, 190	Nullity
<i>Shifting for the better, helpeth Plants and Living Creatures</i> 95	x

A Table of the chief Matters

<p>Quality and Entity of Sounds, <i>ibid.</i> 33, 34. Swiftness of Motion, may make Sounds inaudible, <i>ibid.</i> Sounds not an Emission of the Air, <i>ibid.</i> The reasons thereof, 35. Sound not produced without some local motion of the Medium, <i>ibid.</i> Yet distinction to be made betwixt the motion of the Air, and the Sounds themselves, <i>ibid.</i> 36. Great Sounds, cause great motions in the Air, and other Bodies, <i>ibid.</i> Have rarefied the Air much, <i>ibid.</i> Have caused Deafness, <i>ibid.</i> Enclosure of Sounds conserveth them, <i>ibid.</i> Sounds partly inclosed, and partly in open Air, <i>ibid.</i> Better heard from without, then from within, <i>ibid.</i> A Semi-cave will convey Sound, better then open Air, <i>ibid.</i> Any long Pole will do the like, <i>ibid.</i> Tryal to be made in a crooked Concave, <i>ibid.</i> Sounds may be created without Air, 37. Difference of Sounds in different Vessels filled with water, <i>ibid.</i> Sound within a Flame, <i>ibid.</i> Sound upon a Barrel empty or fuller, <i>ibid.</i> Sound not created betwixt the Bow and the String, but betwixt the String and the Air <i>ibid.</i></p> <p>Magnitude of Sound, 45. In a Trunck, <i>ibid.</i> The cause thereof, <i>ibid.</i> In an Hunters Horn bigger at the lower end, 38. The cause thereof, <i>ibid.</i> In a Vault under the Earth, <i>ibid.</i> The cause thereof, <i>ibid.</i> In Hawks Bells, rather then upon a piece of Brass in the open Air, <i>ibid.</i> In a Drum, <i>ibid.</i> Further heard by night, then by day, <i>ibid.</i> The cause thereof, <i>ibid.</i> Increased by the concurrent reflexion, <i>ibid.</i> Increased by the Sound-board in Instruments, <i>ibid.</i> In an Irish Harp, <i>ibid.</i> The cause of the loud sound thereof, <i>ibid.</i> In a Virginal the Lid shut, <i>ibid.</i> In a Concave within a wall, <i>ibid.</i> 38, 39. In a Bow-string, the Horn of the Bow laid to the ear, <i>ibid.</i> 39. The like in a Rod of Iron or Brass, <i>ibid.</i> The like conveyed by a Pillar of Wood, from an upper Chamber to a lower, <i>ibid.</i> The like from the bottom of a well, <i>ibid.</i> Five ways of Majoration of Sounds <i>ibid.</i></p> <p>Exility of Sounds through any porous Bodies, <i>ibid.</i> 39. Through water, <i>ibid.</i> 40. Strings stopped short <i>ibid.</i></p> <p>Damping of Sounds, <i>ibid.</i> with a soft Body, <i>ibid.</i> Iron hot, not so sounding as cold, <i>ib.</i> water warm, not so sounding in the fall as cold <i>ibid.</i></p> <p>Loudness and softness of Sounds, differ from Magnitude and Exility, 41. Loudness of Sounds, <i>ibid.</i> Quickness of Percussion, cause of the loudness <i>ibid.</i></p>	<p>Communication of Sounds 41</p> <p>Inequality of Sounds, 42. Unequal Sounds ingrate, <i>ibid.</i> Grateful, <i>ibid.</i> Musical and Immusical Sounds, at pleasure ouely in Men and Birds, <i>ibid.</i> Humming of Bees an unequal Sound, 43. Metals quenched give an hissing Sound <i>ibid.</i></p> <p>Base and Treble Sounds, <i>ibid.</i> Two causes of Treble in Strings, <i>ibid.</i> Proportion of the Air percussed in Treble and Base, 53. Tryal hereof to be made in the winding up of a String, <i>ibid.</i> 44. In the distances of Frets, <i>ibid.</i> In the Bores of wind-Instruments <i>ibid.</i></p> <p>Interior and Exterior Sounds, 45. Their difference, <i>ibid.</i> Several kinds of each <i>ibid.</i></p> <p>Articulation of Sounds, 46. Articulate Sounds in every part of the Air, <i>ibid.</i> Winds hinder not the Articulation, <i>ibid.</i> Distance hindreth, <i>ibid.</i> speaking under water hindreth it not, <i>ibid.</i> Articulation requireth a Mediocrity of Sound, <i>ibid.</i> Confounded in a Room over an arched Vault, <i>ibid.</i> Motions of the Instruments of Speech, towards the forming of the Letters, <i>ib.</i> Instruments of Voice, which they are, <i>ibid.</i> 46, 47. Inarticulate Voices and Inaimate Sounds have a similitude with divers Letters <i>ibid.</i></p> <p>Motions of Sounds, 49. They move in round, <i>ibid.</i> May move in an arched Line, <i>ibid.</i> Supposed that Sounds move better downwards then upwards, <i>ibid.</i> 50. Tryal of it <i>ibid.</i></p> <p>Lasting of Sounds, <i>ibid.</i> Sounds continue not, but renew, <i>ibid.</i> Great Sounds heard at far distance, <i>ibid.</i> Not in the instant of the Sound, but long after, <i>ibid.</i> Object of sight, quicker then Sound, 50, 51. Sounds vanish by degrees, which the Objects of sight do not, <i>ibid.</i> The cause thereof <i>ibid.</i></p> <p>Passage of Sounds through other Bodies, 51. The Body intercepting, must not be very thick, <i>ibid.</i> The Spirits of the Body intercepting, whether they co-operate in the Sound, <i>ibid.</i> Sound not heard in a long down-right Arch, <i>ibid.</i> Passeth easily through Foraminous Bodies, <i>ibid.</i> Whether diminished in the passage through small Crannies 52</p> <p>Medium of Sounds, <i>ibid.</i> Air the best Medium, <i>ibid.</i> Thin Air not so good as thick Air, <i>ibid.</i> Whether Flame be a fit Medium, <i>ibid.</i> Whether other Liquors beside water <i>ibid.</i></p> <p>Figures of the differents of Sounds, 52. Several tryals of them <i>ibid.</i></p> <p>Mixtures of Sounds, 52. Audibles mingle in the Medium, which Visibles do not, <i>ibid.</i> The</p>

--	---

His Lordships usual Receipt for the Gout (to which, the Sixtieth Experiment hath reference) was this.

To be taken in this order.

1. The Poullice.

℞. Of Manchet, about three Ounces, the Crum onely, thin cut; let it be boiled in Milk till it grow to a Pulp; add in the end, a Dram and a half of the Powder of Red Rosés.

Of Saffron ten Grains.

Of Oyl of Rosés an Ounce.

Let it be spread upon a Linnen Cloth, and applied luke-warm, and continued for three hours space.

2. The Bath or Fomentation.

℞. Of Sage-Leaves, half an handful.

Of the Root of Hemlock sliced, six Drams.

Of Briony Roots, half an Ounce.

Of the Leaves of Red Rosés, two Pugils.

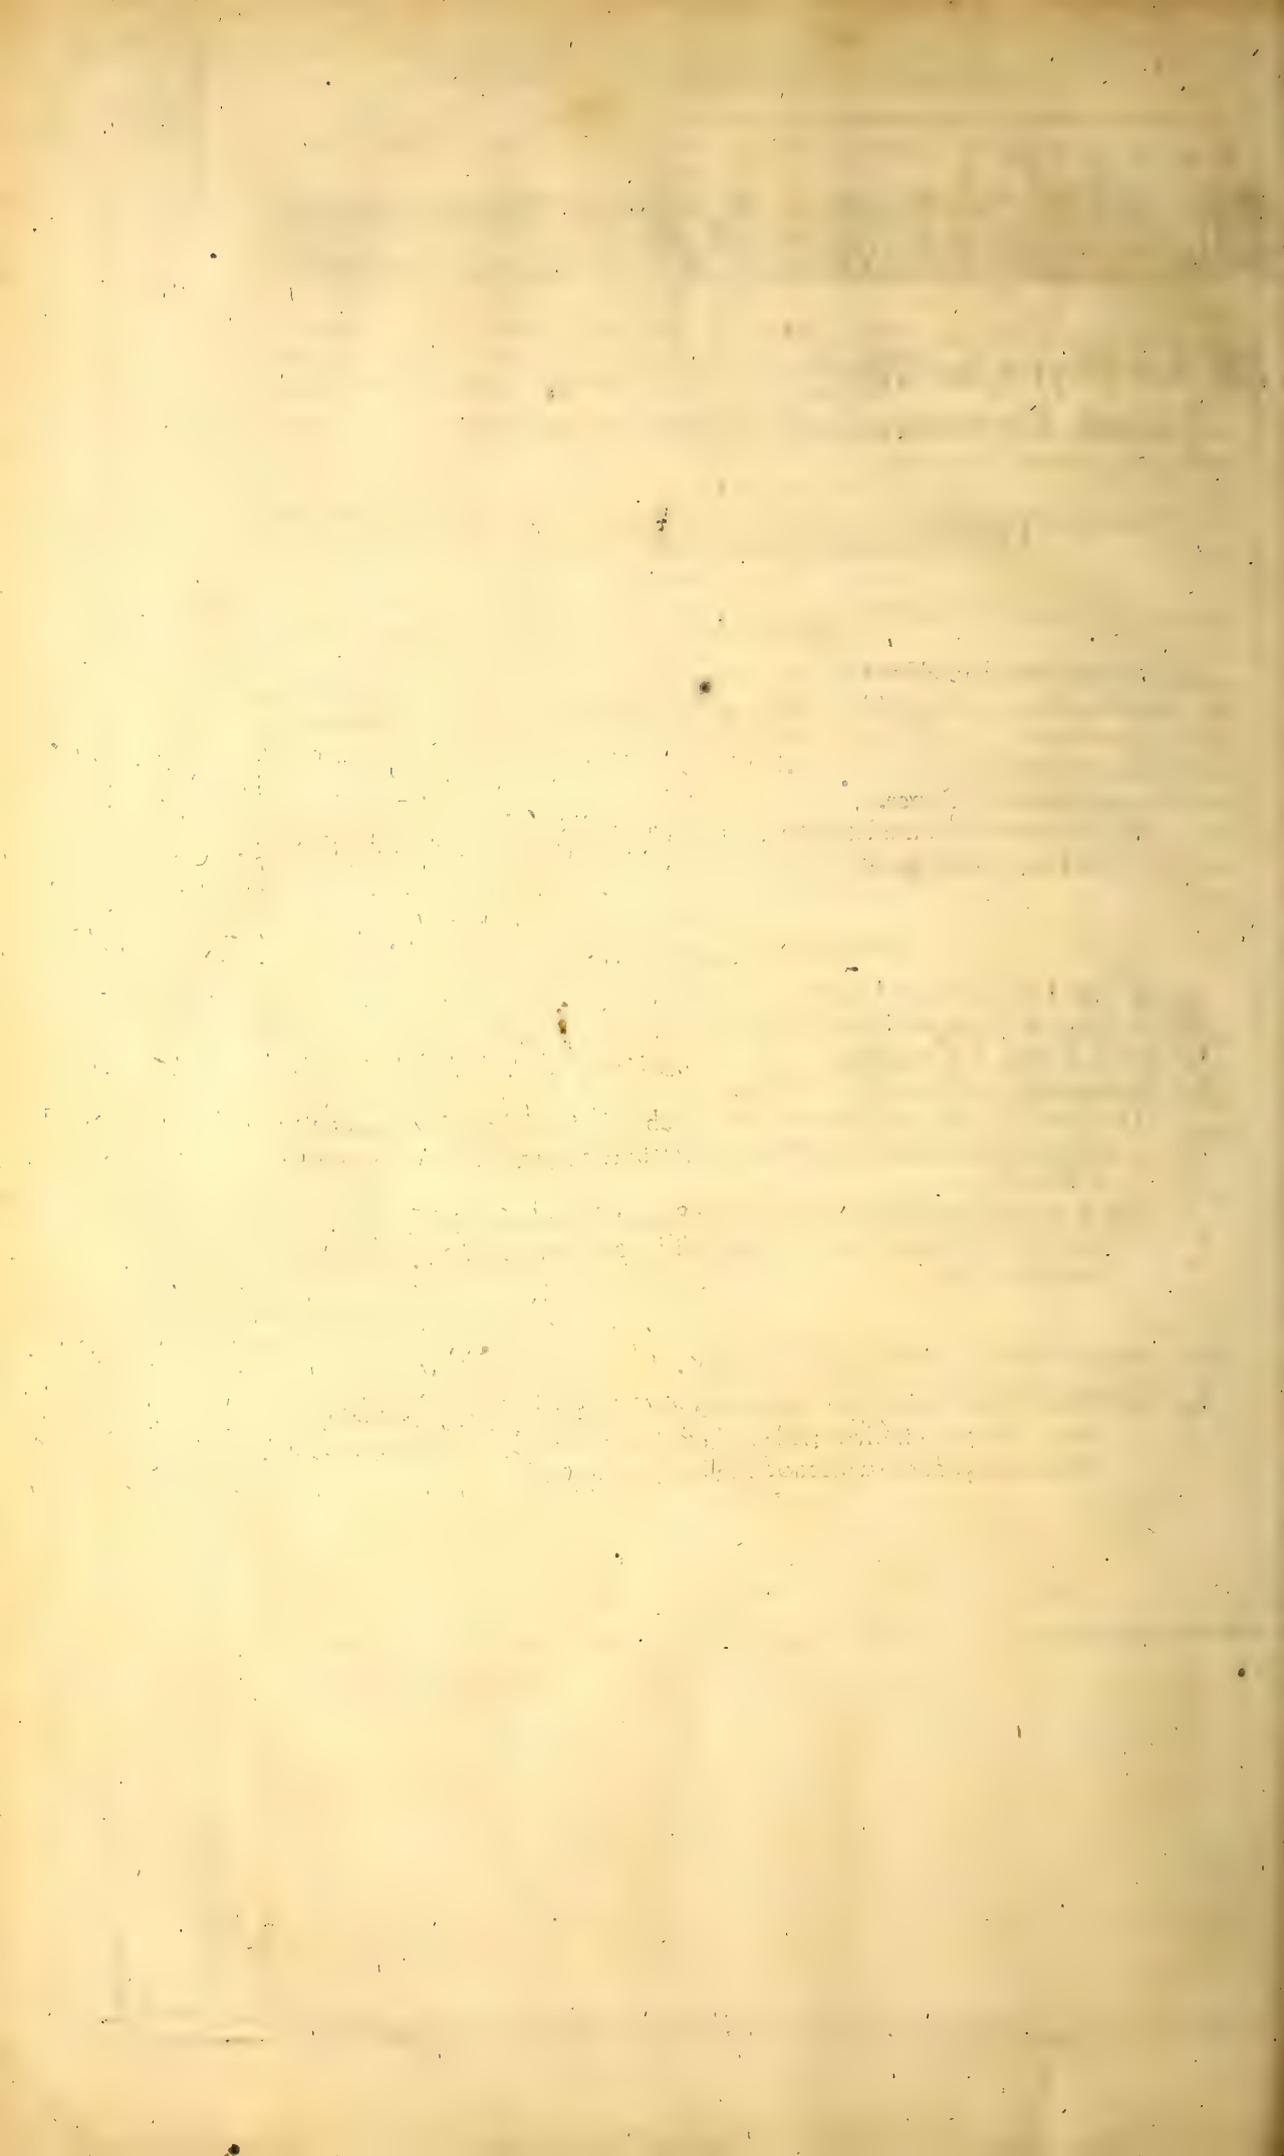

Let them be boiled in a Pottle of Water wherein Steel hath been quenched, till the Liquor come to a Quart; after the straining, put in half an handful of Bay-Salt.

Let it be used with Scarlet-Cloth, or Scarlet-Wool, dipped in the Liquor hot, and so renewed seven times; all in the space of a quarter of an hour or little more.

3. The Plaster.

℞. *Emplastrum Diacalcitheos*, as much as is sufficient for the part you mean to cover; let it be dissolved with Oyl of Rosés in such a consistence as will stick, and spread upon a piece of Holland, and applied.

FINIS.

THE
HISTORY
OF
Life and Death.

The Preface.

IT is an ancient saying and complaint, That *Life* is short and *Art* long; wherefore it behoveth us, who make it our chiefest aim to perfect *Arts*, to take upon us the consideration of *Prolonging Mans Life*, *GOD*, the *Author* of all *Truth* and *Life*, prospering our Endeavors. For though the *Life* of *Man* be nothing else but a mass and accumulation of sins and sorrows, and they that look for an *Eternal Life* set but light by a *Temporary*: Yet the continuation of *VVorks* of *Charity* ought not to be contemned, even by us *Christians*. Besides, the beloved *Disciple* of our *Lord* survived the other *Disciples*; and many of the *Fathers* of the *Church*, especially of the holy *Monks* and *Hermits*, were long-lived: *VVhich* shews, that this blessing of long life, so often promised in the *Old Law*, had less abatement after our *Saviours* days then other earthly blessings had; but to esteem of this as the chiefest good, we are but too prone. Onely the enquiry is difficult how to attain the same; and so much the rather, because it is corrupted with false opinions and vain reports: For both those things which the vulgar *Physicians* talk of, *Radical Moisture* and *Natural Heat*, are but meer *Fictions*; and the immoderate
B
praises

The Preface.

praises of *Chymical Medicines*, first puff up with vain hopes, and then fail their admirers.

And as for that *Death* which is caused by Suffocation, Putrefaction, and several Diseases, we speak not of it now, for that pertains to an *History of Physick*; but onely of that *Death* which comes by a total decay of the Body, and the Inconcoction of old Age. Nevertheless the last act of *Death*, and the very extinguishing of *Life* it self, which may to many ways be wrought outwardly and inwardly (which notwithstanding have, as it were, one common Porch before it comes to the point of death) will be pertinent to be inquired of in this Treatise; but we reserve that for the last place.

That which may be repaired by degrees, without a total waste of the first stock, is potentially eternal, as the *Vestal Fire*. Therefore when *Physicians* and *Philosophers* saw that living Creatures were nourished and their Bodies repaired, but that this did last onely for a time, and afterwards came old age, and in the end dissolution; they sought *Death* in somewhat which could not properly be repaired, supposing a *Radical Moisture* incapable of solid reparation, and which, from the first infancy, received a spurious addition, but no true reparation, whereby it grew daily worse and worse, and, in the end, brought the bad to none at all. This conceit of theirs was both ignorant and vain; for all things in living Creatures are in their youth repaired entirely; nay, they are for a time increased in quantity, bettered in quality, so as the Matter of reparation might be eternal, if the Manner of reparation did not fail. But this is the truth of it, There is in the declining of age an unequal reparation; some parts are repaired easily, others with difficulty and to their loss; so as from that time the Bodies of Men begin to endure the torments of *Mezentius*, *That the living die in the embraces of the dead*; and the parts easily repairable, through their conjunction with the parts hardly repairable, do decay: For the *Spirits, Blood, Flesh, and Fat* are, even after the decline of years, easily repaired; but the drier and more porous parts (as the *Membranes, all the Tunicles, the Sinews, Arteries, Veins, Bones, Cartilages, most of the Bowels, in a word, almost all the Organical Parts*) are hardly repairable, and to their loss. Now these hardly-repairable parts, when they come to their office of repairing the other which are easily repairable, finding themselves deprived of their wonted ability and strength, cease to perform any longer their proper Functions: By which means it comes to pass, that in process of time the whole tends to dissolution; and even those very parts which in their own nature are with much ease repairable, yet through the decay of the Organs of reparation can no more receive reparation, but decline, and in the end utterly fail. And the cause of the termination of *Life* is this, for that the *Spirits*, like a gentle flame, continually preying upon Bodies, conspiring with the outward *Air*, which is ever sucking and drying of them, do, in time, destroy the whole Fabrick of the Body, as also the particular Engines and Organs thereof, and make them unable for the work of Reparation. These are the true ways of *Natural Death*, well and faithfully to be revolved in our mindes; for he that knows not the ways of *Nature*, how can he succor her, or turn her about?

Therefore the *Inquisition* ought to be twofold; the one touching the *Consumption* or *Depredation* of the Body of Man; the other touching the *Reparation* and *Renovation* of the same: To the end, that the former may,

The Preface.

as much as is possible, be forbidden and restrained, and the latter comforted. The former of these pertains, especially to the *Spirits* and outward *Air*, by which the Depredation and Waste is committed; the latter to the whole race of *Alimentation* or *Nourishment*, whereby the Renovation or Restitution is made. And as for the former part touching *Consumption*, this hath many things common with *Bodies Inanimate*, or without life. For such things as the *Native Spirit* (which is in all tangible Bodies, whether living or without life) and the ambient or external Air worketh upon *Bodies Inanimate*, the same it attempteth upon *Animate* or *Living Bodies*; although the *Vital Spirit* superadded, doth partly break and bridle those operations, partly exalt and advance them wonderfully. For it is most manifest that *Inanimate Bodies* (most of them) will endure a long time without any *Reparation*; but *Bodies Animate* without *Food* and *Reparation* suddenly fall and are extinguished, as the Fire is. So then, our *Inquisition* shall be double. First, we will consider the Body of Man as *Inanimate*, and not repaired by *Nourishment*: Secondly, as *Animate* and repaired by *Nourishment*. Thus having Prefaced these things, we come now to the *Topick* places of *Inquisition*.

TO THE READER.

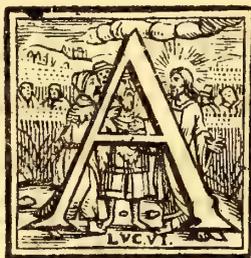

I Am to give Advertisement, that there came forth of late a *Translation* of this *Book* by an unknown *Person*, who though he wished well to the propagating of his *Lordships Works*, yet he was altogether unacquainted with his *Lordships* stile and manner of Expressions, and so published a *Translation* lame and defective in the whole. Whereupon I thought fit to recommend the same to be translated anew by a more diligent and zealous Pen, which hath since travelled in it; and though it still comes short of that lively and incomparable Spirit and Expression, which lived and died with the *Author*, yet I dare avouch it to be much more warrantable and agreeable then the former. It is true, this *Book* was not intended to have been published in *English*; but seeing it hath been already made free of that *Language*, whatsoever benefit or delight may redound from it, I commend the same to the *Courteous* and *Judicious Reader*.

W. R.

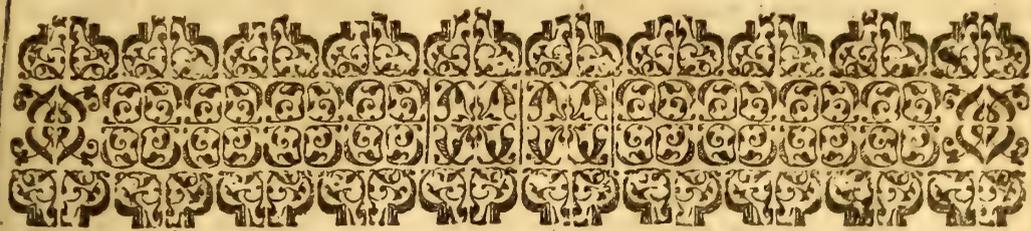

To the present Age and Posterity,
Greeting.

Although I had ranked the History of Life and Death as the last amongst my Six Monethly Designations; yet I have thought fit, in respect of the prime use thereof, (in which the least loss of time ought to be esteemed precious) to invert that order, and to send it forth in the second place. For I have hope, and wish, that it may conduce to a common good; and that the Nobler sort of Physicians will advance their thoughts, and not employ their times wholly in the sordidness of Cures, neither be honored for Necessity onely, but that they will become Coadjutors and Instruments of the Divine Omnipotence and Clemency in Prolonging and Renewing the Life of Man; especially seeing I prescribe it to be done by safe, and convenient, and civil ways, though hitherto unassayed. For though we Christians do continually aspire and pant after the Land of Promise; yet it will be a token of Gods favor towards us, in our journeyings through this Worlds Wilderness, to have our Shoes and Garments (I mean those of our frail Bodies) little worn or impaired.

FR. ST. ALBANS.

THE

T H E

Particular Topick Places ;

OR,

ARTICLES of INQUISITION

TOUCHING

LIFE and DEATH.

1. **F**irst, inquire of *Nature durable*, and *Not durable*, in Bodies Inanimate or without Life, as also in Vegetables ; but that not in a large or just Treatise, but as in a Brief or Summary onely.

2. Also inquire diligently of *Desiccation*, *Arefaction*, and *Consumption* of *Bodies Inanimate*, and of *Vegetables* ; and of the ways and processes, by which they are done ; and further, of Inhibiting and Delaying of *Desiccation*, *Arefaction*, and *Consumption*, and of the *Conservation* of *Bodies*, in their proper state ; and again, of the *Inteneration*, *Emollition*, and *Recovery* of *Bodies* to their former freshness, after they be once dryed and withered.

Neither need the *Inquisition* touching these things, to be full or exact, seeing they pertain rather to their proper Title of *Nature durable* ; seeing also, they are not Principals in this *Inquisition*, but serve onely to give light to the *Prolongation* and *Instauration* of *Life* in *Living creatures*. In which (as was said before) the same things come to pass, but in a particular manner. So from the *Inquisition* touching *Bodies Inanimate* and *Vegetables*, let the *Inquisition* pass on to other *Living Creatures* besides *Man*.

3. Inquire touching the *length* and *shortness* of *Life* in *Living Creatures*, with the due circumstances which make most for their long or short lives.

4. But because the *Duration* of *Bodies* is twofold, One in *Identity*, or the self-same substance, the other by a *Renovation* or *Reparation* ; whereof the former hath place onely in *Bodies Inanimate*, the latter in *Vegetables* and *Living Creatures*, and is perfected by *Alimentation* or *Nourishment* ; therefore it will be fit to inquire of *Alimentation*, and of the ways and progresses thereof ; yet this not exactly, (because it pertains properly to the Titles of *Assimilation* and *Alimentation*) but, as the rest, in progress onely.

From the *Inquisition* touching *Living Creatures*, and *Bodies* repaired by *Nourishment*, pass on to the *Inquisition* touching *Man*. And now being come to the principal subject of *Inquisition*, the *Inquisition* ought to be in all points more precise and accurate.

5. Inquire touching the *length* and *shortness* of *Life* in *Men*, according to the *Ages* of the *World*, the several *Regions*, *Climates*, and *Places* of their *Nativity* and *Habitation*.

6. Inquire touching the *length* and *shortness* of *Life* in *Men*, according to their *Races* and *Families*, as if it were a thing hereditary ; also according to their *Complexions*, *Constitutions*, and *Habits* of *Body*, their *Statures*, the *manner* and *time* of their growth, and the making and composition of their *Members*.

7. Inquire touching the *length* and *shortness* of *Life* in *Men*, according to the times of their *Nativity* ; but so, as you omit for the present all *Astrological* observations, and the *Figures* of *Heaven*, under which they were born ; onely insist upon the vulgar and manifest

manifest Observations ; as whether they were born in the Seventh, Eighth, Ninth, or Tenth Moneth ; also, whether by Night or by Day, and in what Moneth of the Year.

8. Inquire touching the *Length and Shortness of Life in Men*, according to their *Fare, Diet, Government of their Life, Exercises*, and the like. For as for the *Air*, in which Men live and make their abode, we account that proper to be inquired of in the above-said *Article*, touching the places of their *Habitation*.
9. Inquire touching the *Length and Shortness of Life in Men*, according to their *Studies*, their several *Courses of Life*, the *Affections of the Minde*, and divers *Accidents* befalling them.
10. Inquire apart touching those *Medicines* which are thought to prolong *Life*.
11. Inquire touching the *Signs and Prognosticks of long and short life* ; not those which betoken *Death* at hand, (for they belong to an *History of Physick*) but those which are seen and may be observed even in *Health*, whether they be *Physiognomical signs*, or any other.
- Hitherto have been propounded *Inquisitions* touching *Length and Shortness of Life*, besides the *Rules of Art*, and in a confused manner ; now we think to add some, which shall be more *Art-like*, and tending to practice, under the name of *Intentions*. Those *Intentions* are generally three : As for the particular *Distributions* of them, we will propound them when we come to the *Inquisition* it self. The three general *Intentions* are, the *Forbidding of Waste and Consumption*, the *Perfecting of Reparations*, and the *Renewing of Oldness*.
12. Inquire touching those things which conserve and exempt the *Body of Man* from *Arefaction and Consumption*, at least which put off and protract the inclination thereunto.
13. Inquire touching those things which pertain to the whole process of *Alimentation*, (by which the *Body of Man* is repaired) that it may be good, and with the best improvement.
14. Inquire touching those things which purge out the *old Matter*, and supply with new ; as also which do Intenerate and Moisten those parts which are already dried and hardened. But because it will be hard to know the *Ways of Death*, unless we search out and discover the *Seat, or House, or rather Den of Death*, it will be convenient to make *Inquisition* of this thing ; yet not of every kinde of *Death*, but of those *Deaths* which are caused by want and indigence of *Nourishment*, not by violence ; for they are those *Deaths* onely which pertain to a decay of *Nature*, and meer *old Age*.
15. Inquire touching the *Point of Death*, and the *Porches of Death*, leading thereunto from all parts, so as that *Death* be caused by a decay of *Nature*, and not by *Violence*. Lastly, because it is behoveful to know the *Character and Form of Old Age*, which will then best be done, if you make a *Collection* of all the *Differences*, both in the *State and Functions of the Body*, betwixt *Youth and Old Age*, that by them you may observe what it is that produceth such manifold *Effects* ; let not this *Inquisition* be omitted.
16. Inquire diligently touching the *Differences in the State of the Body and Faculties of the Minde in Youth and Old Age* ; and whether there be any that remain the same without alteration or abatement in *Old Age*.
- 17.

Nature Durable, and not Durable.

The History.

Article.

1.

2.

3.

Metals are of that long lasting, that Men cannot trace the beginnings of them ; and when they do decay, they decay through *Rust*, not through perspiration into *Air* ; yet *Gold* decays neither way.

Quick-silver, though it be an humid and fluid *Body*, and easily made volatile by *Fire* ; yet (as far as we have observed) by *Age* alone, without *Fire*, it neither wasteth nor gathereth *Rust*.

Stones, especially the harder sort of them, and many other *Fossiles*, are of long lasting

ing, and that though they be exposed to the open air; much more if they be buried in the earth. Notwithstanding *Stones* gather a kind of *Nitre*, which is to them instead of *Rust*. *Precious Stones* and *Crystals* exceed *Metalls* in long lasting; but then they grow dimmer and less Orient, if they be very old.

It is observed, that *Stones* lying towards the North do sooner decay with age than those that lie toward the South; and that appears manifestly in *Pyramids*, and *Churches*, and other ancient *Buildings*: contrariwise, in *Iron*, that exposed to the South, gathers *Rust* sooner, and that to the North later; as may be seen in the *Iron-bars* of windows. And no marvel, seeing in all putrefaction (as *Rust* is) Moisture hastens Dissolutions; in all simple Arefaction, Driness.

In *Vegetables*, (we speak of such as are fell'd, not growing) the Stocks or Bodies of harder *Trees*, and the Timber made of them, last divers ages. But then there is difference in the bodies of *Trees*: some *Trees* are in a manner spongy, as the *Elder*, in which the pith in the midst is soft, and the outward part harder; but in *Timber-trees*, as the *Oak*, the inner part (which they call *Heart of Oak*) lasteth longer.

The *Leaves*, and *Flowers*, and *Stalks* of *Plants* are but of short lasting, but dissolve into dust, unless they putrefie: the *Roots* are more durable.

The *Bones* of living Creatures last long, as we may see it of mens bones in Charnel-houses: *Horns* also last very long; so do *Teeth*, as it is seen in *Ivory*, and the *Sea-horse Teeth*.

Hides also and *Skins* endure very long, as is evident in old *Parchment-books*: *Paper* likewise will last many ages, though not so long as *Parchment*.

Such things as have passed the *Fire* last long, as *Glass* and *Bricks*; likewise *Flesh* and *Fruits* that have passed the *Fire* last longer than *Raw*: and that not onely because the Baking in the *Fire* forbids putrefaction; but also because the watry humour being drawn forth, the oily humour supports it self the longer.

Water of all *Liquors* is soonest drunk up by *Air*, contrariwise *Oil* latest; which we may see not onely in the *Liquors* themselves, but in the *Liquors* mixt with other Bodies: for *Paper* wet with water, and so getting some degree of transparency, will soon after wax white, and lose the transparency again, the watry vapour exhaling; but oiled *Paper* will keep the transparency long, the *Oil* not being apt to exhale: And therefore they that counterfeit mens hands, will lay the oiled paper upon the writing they mean to counterfeit, and then assay to draw the lines.

Gums all of them last very long; the like do *wax* and *Honey*.

But the equal or unequal use of things conduceth no less to long lasting or short lasting, than the things themselves; for *Timber*, and *Stones*, and other *Bodies*, standing continually in the *water*, or continually in the *air*, last longer than if they were sometimes wet, sometimes dry: and so *Stones* continue longer, if they be laid towards the same coast of Heaven in the Building that they lay in the Mine. The same is of *Plants* removed, if they be coasted just as they were before.

Observations.

Let this be laid for a Foundation, which is most sure, That there is in every Tangible body a Spirit, or body Pneumatical, enclosed and covered with the Tangible parts; and that from this Spirit is the beginning of all Dissolution and Consumption, so as the Antidote against them is the detaining of this Spirit.

This Spirit is detained two ways: either by a streight Inclosure, as it were in a Prison: or by a kind of free and voluntary Detention. Again, this voluntary stay is perswaded two ways: either if the Spirit it self be not too moveable or eager to depart; or if the external Air importune it not too much to come forth. So then, two sorts of Substances are durable, Hard Substances, and Oily: Hard Substance binds in the Spirits close; Oily partly enticeth the Spirit to stay, partly is of that nature that it is not importuned by Air; for Air is consubstantial to Water, and Flame to Oil. And touching Nature Durable and not Durable in Bodies Inanimate, thus much.

The History.

Herbs of the colder sort die yearly both in Root and Stalk; as *Lettice*, *Purslane*; also *Wheat* and all kind of *Corn*: yet there are some cold Herbs which will last

- three or four years; as the *Violet*, *Straw-berry*, *Burnet*, *Prim-rose*, and *Sorrel*. But *Borage* and *Bugloss*, which seem so alike when they are alive, differ in their deaths; for *Borage* will last but one year, *Bugloss* will last more.
14. But many *hot Herbs* bear their age and years better; *Hyssop*, *Thyme*, *Savory*, *Pot-marjoram*, *Balm*, *wormwood*, *Germander*, *sage*, and the like. *Fennel* dies yearly in the stalk, buds again from the root: but *Fulse* and *Sweet-marjoram* can better endure age than winter; for being set in a very warm place and well-fenced, they will live more than one year. It is known, that a knot of *Hyssop* twice a year thorn hath continued forty years.
15. *Bushes* and *shrubs* live threescore years, and some double as much. A *Vine* may attain to threescore years, and continue fruitful in the old age. *Rose-mary* well placed will come also to threescore years; but *white Thorn* and *Ivy* endure above an hundred years. As for the *Bramble*, the age thereof is not certainly known, because bowing the head to the ground it gets new roots, so as you cannot distinguish the old from the new.
16. Amongst great *Trees* the longest livers are the *Oak*, the *Holm*, *Wild-ash*, the *Elm*, the *Beech-tree*, the *Chest-nut*, the *Plane-tree*, *Ficus Ruminialis*, the *Lote tree*, the *wild-olive*, the *Palm-tree* and the *Mulberry tree*. Of these, some have come to the age of eight hundred years; but the least livers of them do attain to two hundred.
17. But *Trees Odorate*, or that have sweet woods, and *Trees Rozennie*, last longer in their Woods or Timber than those above-said, but they are not so long-liv'd; as the *Cypress-tree*, *Maple*, *Pine*, *Box*, *Juniper*. The *Cedar* being born out by the vastness of his body, lives well-near as long as the former.
18. The *Ash*, fertile and forward in bearing, reacheth to an hundred years and somewhat better; which also the *Birch*, *Maple*, and *Sirvice-tree* sometimes do: but the *Poplar*, *Lime-tree*, *willow*, and that which they call the *Sycamore*, and *walnut-tree*, live not so long.
19. The *Apple-tree*, *Pear-tree*, *Plum-tree*, *Pomegranate-tree*, *Citron-tree*, *Medlar-tree*, *Black-cherry-tree*, *Cherry-tree*, may attain to fifty or sixty years; especially if they be cleansed from the Moss wherewith some of them are cloathed.
20. Generally, greatness of body in trees, if other things be equal, hath some congruity with length of life; so hath hardness of substance: and trees bearing Mast or Nuts are commonly longer livers than trees bearing Fruit or Berries: likewise trees putting forth their leaves late, and shedding them late again, live longer than those that are early either in leaves or fruit: the like is of wild-trees in comparison of Orchard-trees. And lastly, in the same kind, trees that bear a *sowr fruit* out-live those that bear a *sweet fruit*.

An Observation.

Aristotle noted well the difference between Plants and living Creatures, in respect of their Nourishment and Reparation: Namely, that the bodies of living Creatures are confined within certain bounds, and that after they be come to their full growth they are continued and preserved by Nourishment, but they put forth nothing new except Hair and Nails, which are counted for no better than Excrements; so as the juice of living creatures must of necessity sooner wax old: but in Trees, which put forth yearly new boughs, new shoots, new leaves, and new fruits, it comes to pass that all these parts in Trees are once a year young and renewed. Now it being so, that whatsoever is fresh and young draws the Nourishment more lively and chearfully to it than that which is decayed and old, it happens withall, that the stock and body of the tree, through which the sap passeth to the branches, is refreshed and cheared with a more bountiful and vigorous nourishment in the passage than otherwise it would have been. And this appears manifest (though Aristotle noted it not, neither hath he expressed these things so clearly and perspicuously) in Hedges, Copses, and Pollards, when the plashing, shedding, or lopping comforteth the old stem or stock, and maketh it more flourishing and longer-liv'd.

Desiccation, Prohibiting of Desiccation, and In-teneration of that which is desiccated and dried.

The History.

Fire and strong Heats dry some things, and melt others.

Limus ut hic durefcit, & hac ut Cera liquefcit, Uno eodemque Igne ?

How this Clay is hardened, and how this wax is melted, with one and the same thing, Fire ? It drieth Earth, Stones, wood, Cloth, and Skins, and whatsoever is not liquefiable ; and it melteth Metals, wax, Gums, Butter, Tallow, and the like.

Notwithstanding, even in those things which the fire melteth, if it be very vehement and continueth, it doth at last dry them. For metal in a strong fire, (Gold onely excepted) the volatile part being gone forth, will become less ponderous and more brittle ; and those oily and fat substances in the like fire will burn up, and be dried and parched.

Air, especially open Air, doth manifestly dry, but not melt : as High ways, and the upper part of the Earth, moistned with showers, are dried ; linnen clothes washed, if they be hang'd out in the air, are likewise dried ; herbs, and leaves, and flowers, laid forth in the shade, are dried. But much more suddenly doth the Air this, if it be either enlightened with the Sun-beams, (so that they cause no putrefaction) or if the air be stirred, as when the wind bloweth, or in rooms open on all sides.

Age most of all, but yet slowest of all, drieth ; as in all bodies which (if they be not prevented by putrefaction) are drie with Age. But age is nothing of it self, being onely the measure of time ; that which causeth the effect is the native Spirit of bodies, which sucketh up the moisture of the body, and then, together with it, flieth forth ; and the air ambient, which multiplieth it self upon the native spirits and juices of the body, and preyeth upon them.

Cold of all things most properly drieth : for drying is not caused but by contraction ; now contraction is the proper work of cold. But because we Men have heat in a high degree, namely, that of Fire, but cold in a very low degree, no other than that of Winter, or perhaps of Ice, or of snow, or of Nitre ; therefore the drying caused by cold is but weak, and easily resolved. Notwithstanding we see the surface of the earth to be more dried by Frost, or by March-winds, than by the sun, seeing the same wind both licketh up the moisture and affecteth with coldness.

Smok is a drier, as in Bacon and Neats tongues which are hanged up in the chimneys : and Perfumes of Olibanum, or Lignum Aloes, and the like, dry the Brain, and cure Catarrhs.

Salt, after some reasonable continuance, drieth, not onely on the out-side, but in the inside also ; as in Flesh and Fish salted, which if they have continued any long time have a manifest hardness within.

Hot Gums applied to the skin dry and wrinkle it ; and some astringent waters also do the same.

Spirit of strong waters imitateth the fire in drying : for it will both potch an Egg put into it, and toast Bread.

Powders dry like Sponges by drinking up the moisture, as it is in Sand thrown upon Lines new written : also smoothness and politeness of bodies, (which suffer not the vapour of moisture to go in by the pores) dry by accident, because it exposeth it to the air ; as it is seen in precious Stones, Looking glasses, and Blades of Swords, upon which if you breath, you shall see at first a little mist, but soon after it vanisheth like a cloud. And thus much for Desiccation or Drying.

They use at this day in the East parts of Germany Garners in Vaults under ground, wherein they keep Wheat and other grains, laying a good quantity of straw both under the grains and about them, to save them from the dampness of the Vault ; by which device they keep their grains 20 or 30 years. And this doth not onely preserve them from fustiness, but (that which pertains more to the present inquisition) preserves them also in that greenness that they are fit and servicable to make bread. The same is reported to have been in use in Cappadocia and Thracia, and some parts of Spain.

The placing of Garners on the tops of houses, with windows towards the East and North, is very commodious. Some also make two Sollars, an upper and a lower ; and the upper sollar hath an hole it, through which the grain continually descendeth, like sand in an hour-glass, and after a few dayes they throw it up again with shovels, that so it may be in continual motion. Now it is to be noted

11.

12.

that this doth not only prevent the Fustiness, but conserveth the Greeness, and slacketh the Desiccation of it. The Cause is that which we noted before, That the discharging of the *Watry humour*, which is quickned by the *Motion* and the *Winds*, preserves the *Oily humour* in his being, which otherwise would fly out together with the *Watry humour*. Also in some Mountains, where the *Air* is very pure, *dead Carcases* may be kept for a good while without any great decay.

13. *Fruits*, as *Pomegranates*, *Citrons*, *Apples*, *Pears*, and the like; also *Flowers*, as *Roses* and *Lilies*, may be kept a long time in Earthen Vessels close stopped: howsoever, they are not free from the injuries of the outward *Air*, which will affect them with his unequal Temper through the sides of the Vessel, as it is manifest in heat and cold. Therefore it will be good to stop the mouths of the Vessels carefully; and to bury them within the *Earth*; and it will be as good not to bury them in the *Earth*, but to sink them in the *Water*, so as the place be shady, as in *Wells* or *Cisterns* placed within doors: but those that be sunk in *Water* will do better in *Glass vessels* than in *Earthen*.
14. Generally those things which are kept in the *Earth*, or in *Vaults* under ground, or in the *bottom* of a *Well*, will preserve their freshness longer than those things that are kept above ground.
15. They say it hath been observed, that in *Conservatories of snow* (whether they were in Mountains, in natural Pits, or in *Wells* made by Art for that purpose) an *Apple*, or *Chest-nut*, or *Nut*, by chance falling in, after many months, when the *Snow* hath melted, hath been found in the *snow* as fresh and fair as if it had been gathered the day before.
16. Country people keep *Clusters of Grapes* in *Meal*, which though it makes them less pleasant to the taste, yet it preserves their moisture and freshness. Also the harder sort of *Fruits* may be kept long, not onely in *Meal*, but also in *Saw-dust*, and in *heaps of Corn*.
17. There is an opinion held, that *bodies* may be preserved fresh in *Liquors* of their own kind, as in their proper *Menstrua*; as, to keep *Grapes* in *Wine*, *Olives* in *Oil*.
18. *Pomegranates* and *Quinces* are kept long, being lightly dipped in *Sea-water* or *Salt-water*, and soon after taken out again, and then dried in the open *Air*, so it be in the *Shade*.
19. *Bodies* put in *wine*, *Oil*, or the *Lees of Oil*, keep long; much more in *Hony* or *Spirit of Wine*; but most of all, as some say, in *Quick-silver*.
20. *Fruits* inclosed in *Wax*, *Pitch*, *Plaster*, *Paste*, or any the like Case or Covering, keep green very long.
21. It is manifest that *Flies*, *Spiders*, *Ants*, or the like small *creatures*, falling by chance into *Amber*, or the *Gums of Trees*, and so finding a burial in them, do never after corrupt or rot, although they be soft and tender *Bodies*.
22. *Grapes* are kept long by being hanged up in *Bunches*: the same is of other *Fruits*. For there is a two-fold Commodity of this thing: the one, that they are kept without *pressing* or *bruising*, which they must needs suffer if they were laid upon any hard substance; the other, that the *Air* doth encompass them on every side alike.
23. It is observed that *Putrefaction*, no less than *Desiccation* in *Vegetables*, doth not begin in every part alike, but chiefly in that part where, being alive, it did attract nourishment. Therefore some advise to cover the *stalks* of *Apples* or other *Fruits* with *Wax* or *Pitch*.
24. Great *Wicks of Candles* or *Lamps* do sooner consume the *Tallow* or *Oil* than lesser *Wicks*; also *Wicks of Cotton* sooner than those of *Rush*, or *Straw*, or small *Twigs*: and in *Staves of Torches*, those of *Juniper* or *Firre* sooner than those of *Ash*: likewise *Flame moved* and *fanned* with the *Wind* sooner than that which is *still*: And therefore *Candles* set in a *Lanthorn* will last longer than in the open *Air*. There is a Tradition, that *Lamps* set in *Sepulchres* will last an incredible time.
25. The *Nature* also and *Preparation* of the *Nourishment* conduceth no less to the *lasting* of *Lamps* and *Candles*, than the nature of the *Flame*; for *Wax* will last longer than *Tallow*, and *Tallow* a little wet longer than *Tallow* dry, and *Wax candles* old made longer than *Wax-candles* new made.
26. *Trees*, if you stir the *Earth* about their *Root* every year, will continue less time; if once in four, or perhaps in ten years, much longer: also *cutting off* the *Suckers* and *young Shoors* will make them live the longer: but *Dunging* them, or laying of *Marl* about their *Roots*, or much *Watering* them, adds to their fertility, but cuts off from their long lasting. And thus much touching the *Prohibiting* of *Desiccation* or *Consumption*.

The Inteneration or making tender of that which is dried (which is the chief Matter) affords but a small number of *Experiments*. And therefore some few *Experiments* which are found in Living Creatures, and also in *Man* shall be joyned together.

27.

Bands of Willow, wherewith they use to binde Trees, laid in Water, grow more flexible; likewise they put Boughs of Birch (the ends of them) in Earthen Pots filled with Water, to keep them from withering; and Bowls cleft with dryness, steep'd in Water, close again.

28.

Boots grown hard and obstinate with age, by greasing them before the Fire with Tallow, wax soft, or being onely held before the Fire get some softness. *Bladders* and *Parchments* hardened also become tender with warm Water, mixed with Tallow or any Fat thing; but much the better, if they be a little chafed.

29.

Trees grown very old, that have stood long without any culture, by digging and opening the Earth about the Roots of them, seem to grow young again, and put forth young Branches.

30.

Old Draught Oxen worn out with labor, being taken from the yolk, and put into fresh Pasture, will get young and tender flesh again, insomuch, that they will eat as fresh and tender as a *Steer*.

31.

A strict Emaciating Diet of *Guaiacum*, *Bisket*, and the like, (wherewith they use to cure the *French-Pox*, *Old catarrhs*, and some kinde of *Dropsies*) doth first bring men to great poverty and leanness, by wasting the Juices and Humors of the Body; which after they begin to be repaired again, seem manifestly more vigorous and young. Nay, and I am of opinion, that Emaciating Diseases afterwards well cured, have advanced many in the way of long life.

32.

Observations.

MEN see clearly, like Owls, in the Night of their own Notions; but in Experience, as in the Day-light they wink and are but half-sighted. They speak much of the Elementary quality of Siccity or Dryness, and of things Desiccating, and of the Natural Periods of Bodies, in which they are corrupted and consumed: But mean while, either in the beginnings, or middle passages, or lasts acts of Desiccation and Consumption, they observe nothing that is of moment.

1.

Desiccation or Consumption in the process thereof, is finished by three Actions; and all these (as was said before) have their original from the Native Spirit of Bodies.

2.

The first Action is, the Attenuation of the Moisture into Spirit; the second is, the Issuing forth or flight of the Spirit; the third is, the Contraction of the grosser parts of the Body immediately after the Spirit issued forth. And this last is, that Desiccation and Induration which we chiefly handle; the former two consume onely.

3.

Touching Attenuation, the matter is manifest. For the Spirit which is inclosed in every Tangible Body forgets not its nature, but whatsoever it meets withal in the Body (in which it is inclosed) that it can digest and master, and turn into it self, that it plainly alters and subdues, and multiplies it self upon it, and begets new Spirit. And this evicted by one proof, instead of many; for that those things which are thoroughly dried are lessened in their weight, and become hollow, porous, and resounding from within. Now it is most certain, that the inward Spirit of any thing, confers nothing to the weight, but rather lig'tens it; and therefore it must needs be, that the same Spirit hath turned into it the moisture and juyce of the Body which weighed before, by which means the weight is lessened. And this is the first Action, the Attenuation of the Moisture, and converting it into Spirit.

4.

The second Action, which is the Issuing forth or Flight of the Spirit, is as manifest also. For that issuing forth, when it is in throngs, is apparent even to the sense; in Vapors to the sight, in Odors to the smelling; but if it issueth forth slowly, (as when a thing is decayed by age) then it is not apparent to the sense, but the matter is the same. Again, where the composition of the Body is either so streight or so tenacious, that the Spirit can finde no pores or passages by which to depart, then, in the striving to get out, it drives before it the grosser parts of the Body, and protrudes them beyond the superficies or surface of the Body; as it is in the rust of Metals, and mould of all Fat things. And this is the second Action, the Issuing forth or Flight of the Spirit.

5.

The third Action is somewhat more obscure, but full as certain; that is, the Contraction of the grosser parts after the Spirit issued forth. And this appears, first, in that Bodies after the Spirit issued forth, do manifestly shrink, and fill a less room; as it is in the

6.

the Kernels of Nuts, which after they are dried, are too little for the Shells; and in Beams and Planchers of Houses, which at first lay close together, but after they are dried, give; and likewise in Bowls, which through drought, grow full of cranies, the parts of the Bowl contracting themselves together, and after contraction must needs be empty spaces. Secondly, It appears by the wrinkles of Bodies dried: For the endeavor of contracting it self is such, that by the contraction it brings the parts nearer together, and so lifts them up; for whatsoever is contracted on the sides, is lifted up in the midst: And this is to be seen in Papers and old Parchments, and in the Skins of Living Creatures, and in the Coats of soft Cheeses, all which, with age, gather wrinkles. Thirdly, This Contraction shows it self most in those things, which by heat are not onely wrinkled, but ruffled, and plighted, and, as it were, rouled together; as it is in Papers, and Parchments, and Leaves, brought near the fire: For Contraction by Age, which is more slow, commonly causeth wrinkles; but Contraction by the Fire, which is more speedy, causeth plighting. Now in most things where it comes not to wrinkling or plighting, there is simple Contraction, and angustiation or streightning, and induration or hardning, and deliccation, as was shewed in the first place. But if the issuing forth of the Spirit, and absumption or waste of the Moisture be so great, that there is not left body sufficient to unite and contract it self, then of necessity Contraction must cease, and the Body become putrid, and nothing else but a little dust cleaving together, which with a light touch is dispersed and falleth asunder; as it is in Bodies that are rotten, and in Paper burnt, and Linnen made into Tinder, and Carkases embalmed after many ages. And this is the third Action, the Contraction of the grosser parts after the Spirit issueth forth.

7. It is to be noted, that Fire and Heat dry onely by accident; for their proper work is to attenuate and dilate the Spirit and Moisture; and then it follows by accident, that the other parts should contract themselves, either for the flying of Vacuum alone, or for some other motion withal, whereof we now speak not.

8. It is certain, that Putrefaction taketh its original from the Native Spirit, so lest there Arefaction; but it goeth on a far different way: For in Putrefaction, the Spirit is not simply vapored forth, but being detained in part, works strange garboils; and the grosser parts are not so much locally contracted, as they congregate themselves to parts of the same nature.

Length and Shortness of Life in Living Creatures.

The History.

To the first Article.

Touching the Length and Shortness of Life in Living Creatures, the Information which may be had, is but slender, Observation is negligent, and Tradition fabulous. In Tame Creatures, their degenerate life corrupteth them; in Wilde Creatures, their exposing to all weathers, often intercepteth them. Neither do those things which may seem concomitants, give any furtherance to this Information, (the greatness of their Bodies, their time of Bearing in the Womb, the number of their young ones, the time of their growth, and the rest) in regard that these things are intermixed, and sometimes they concur, sometimes they sever.

1. Mans age (as far as can be gathered by any certain Narration) doth exceed the age of all other Living Creatures, except it be of a very few onely; and the Concomitants in him are very equally disposed, his stature and proportion large, his bearing in the womb nine moneths, his fruit commonly one at a birth, his puberty at the age of fourteen years, his time of growing till twenty.

2. The Elephant by undoubted relation, exceeds the ordinary race of Mans life; but his bearing in the Womb the space of Ten years, is fabulous; of two years, or at least above one, is certain. Now his bulk is great, his time of growth until the thirtieth year, his teeth exceeding hard; neither hath it been observed, that his blood is the coldest of all Creatures: His age hath sometimes reached to Two hundred years.

3. Lions are accounted long livers, because many of them have been found Toothless, a sign not to certain, for that may be caused by their strong breath.

4. The Bear is a great sleeper, a dull beast, and given to ease; and yet not noted for

for long life : nay, he hath this sign of short life, that his *bearing* in the *womb* is but short, scarce full forty days.

The *Fox* seems to be well disposed in many things for long life ; he is well skinned, feeds on flesh, lives in Dens ; and yet he is noted not to have that property. Certainly he is a kind of *Dog*, and that kind is but short-liv'd.

The *Camel* is a long liver, a lean Creature, and sinewy, so that he doth ordinarily attain to fifty, and sometimes to an hundred years.

The *Horse* lives but to a moderate age, scarce to forty years, his ordinary period is twenty years : but perhaps he is beholden for this shortness of life to *Man* ; for we have now no *Horses* of the *Sun*, that live freely, and at pleasure, in good pastures. Notwithstanding the *Horse* grows till he be six years old, and is able for generation in his old age. Besides, the *Mare* goeth longer with her young one than a *woman*, and brings forth, two at a burthen more rarely. The *Ass* lives commonly to the *Horse's* age ; but the *Mule* out-lives them both.

The *Hart* is famous amongst men for long life, yet not upon any relation that is undoubted. The tell of a certain *Hart* that was found with a Collar about his neck, and that Collar hidden with *Fat*. The long life of the *Hart* is the less credible, because he comes to his perfection at the fifth year ; and not long after his *Horns* (which he sheds and renews yearly) grow more narrow at the Root, and less branched.

The *Dog* is but a short liver, he exceeds not the age of twenty years, and for the most part lives not to fourteen years: a Creature of the hottest temper, and living in extremes ; for he is commonly either in vehement motion, or sleeping : besides, the *Bitch* bringeth forth many at a Burden, and goeth nine weeks.

The *Ox* like wife, for the greatness of his body and strength, is but a short liver, about some sixteen years, and the *Males* live longer than the *Females* ; notwithstanding they bear usually but one at a burden, and go nine months : a Creature dull, fleshy, and soon fattened, and living onely upon Herby substances, without Grain.

The *Sheep* seldom lives to ten years, though he be a creature of a moderate size, and excellently clad ; and, that which may seem a wonder, being a creature with so little a Gall, yet he hath the most curled Coat of any other, for the *Hair* of no Creature is so much curled as *Wool* is. The *Rams* generate not before the third year, and continue able for generation until the eighth. The *Ewes* bear young as long as they live. The *Sheep* is a diseased Creature, and rarely lives to his full age.

The *Goat* lives to the same age with the *Sheep*, and is not much unlike in other things ; though he be a Creature more nimble, and of somewhat a firmer flesh, and so should be longer-liv'd ; but then he is much more lascivious, and that shortens his life.

The *Sow* lives to fifteen years, sometimes to twenty : and though it be a Creature of the moistest flesh, yet that seems to make nothing to *Length of Life*. Of the *Wild Boar* or *Sow* we have nothing certain.

The *Cat's* age is betwixt six and ten years : a creature nimble and full of spirit, whose seed (as *Ælian* reports) burneth the Female ; whereupon it is said, *That the Cat conceives with pain, and brings forth with ease* : A Creature ravenous in eating, rather swallowing down his meat whole than feeding.

Hares and *Conies* attain scarce to seven years, being both Creatures generative, and with young ones of several conceptions in their bellies. In this they are unlike, that the *Coney* lives under ground ; and the *Hare* above ground ; and again, that the *Hare* is of a more dusky flesh.

Birds for the size of their bodies are much lesser than *Beasts* ; for an *Eagle* or *Swan* is but a small thing in comparison of an *Ox* or *Horse*, and so is an *Estrich* to an *Elephant*.

Birds are excellently well-clad : for *Feathers*, for warmth and close sitting to the body, exceed *Wooll* and *Hairs*.

Birds, though they hatch many young ones together, yet they bear them not all in their bodies at once, but lay their Eggs by turns, whereby their Fruit hath the more plentiful nourishment whilst it is in their bodies.

Birds chew little or nothing, but their meat is found whole in their crops, notwithstanding they will break the shells of Fruits, and pick out the *Kernels* : they are thought to be of a very hot and strong concoction.

20. The motion of *Birds* in their flying is a mixt motion, consisting of a moving of the limbs, and of a kind of carriage; which is the most whollome kind of Exercise.
21. *Aristotle* noted well touching the generation of *Birds*, (but he transferred it ill to other living *Creatures*) that the seed of the *Male* confers less to generation than the *Female*, but that it rather affords Activity than Matter; so that fruitful *Eggs* and unfruitful *Eggs* are hardly distinguished.
22. *Birds* (almost all of them) come to their full growth the first year, or a little after. It is true, that their Feathers in some kinds, and their Bills in others, shew their years, but for the growth of their Bodies it is not so.
23. The *Eagle* is accounted a long liver, yet his years are not set down; and it is alledged as a sign of his long life, that he casts his Bill, whereby he grows young again: from whence comes that old Proverb, *The old age of an Eagle*. Notwithstanding perchance the matter may be thus, That the renewing of the *Eagle* doth not cast his bill, but the casting of his bill is the renewing of the *Eagle*, for after that his bill is grown to a great crookedness, the *Eagle* feeds with much difficulty.
24. *Vultures* are also affirmed to be long livers, insomuch that they extend their life well near to an hundred years. *Kites* likewise, and so all *Birds* that feed upon flesh, and *Birds* of prey live long. As for *Hawks*, because they lead a degenerate and servile life for the delight of men, the term of their natural life is not certainly known: notwithstanding amongst *Mewed Hawks* some have been found to have lived thirty years, and amongst *Wild Hawks* forty years.
25. The *Raven* likewise is reported to live long, sometimes to an hundred years: he feeds on Carrion, and flies not often, but rather is a sedentry and malanchollick *Bird*, and hath very black flesh. But the *Crow*, like unto him in most things, (except in greatness and voice) lives not altogether so long, and yet is reckoned amongst the long livers.
26. The *Swan* is certainly found to be a long liver, and exceeds not unfrequently an hundred years. He is a *Bird* excellently plumed, a feeder upon fish, and is always carried, and that in running waters.
27. The *Goose* also may pass amongst the long livers, though his food be commonly grass, and such kind of nourishment; especially the *Wild-Goose*; whereupon this Proverb grew amongst the *Germans*, *Magis senex quam Anser nivalis*, Older than a *Wild-Goose*.
28. *Storks* must needs be long livers, if that be true which was anciently observed of them, that they never came to *Thebes*, because that City was often sacked. This if it were so, then either they must have the knowledge of more ages than one, or else the old ones must tell their young the History. But there is nothing more frequent than *Fables*.
29. For *Fables* do so abound touching the *Phoenix*, that the truth is utterly lost if any such *Bird* there be. As for that which was so much admired, That she was ever seen abroad with a great troop of *Birds* about her, it is no such wonder; for the same is usually seen about an *Owl* flying in the day-time, or a *Parrot* let out of a Cage.
30. The *Parrot* hath been certainly known to have lived threescore years in *England*, how old soever he was before he was brought over: a *Bird* eating almost all kind of meats, chewing his meat, and renewing his bill; likewise curst and mischievous, and of a black flesh.
31. The *Peacock* lives twenty years; but he comes not forth with his *Argus Eyes* before he be three years old; a *Bird* slow of pace, having whitish flesh.
32. The *Dunghill-Cock* is venerious, martial, and but of a short life; a crank *Bird*, having also white flesh.
33. The *Indian-Cock*, commonly called the *Turkey-Cock*, lives not much longer than the *Dunghill-Cock*: an angry *Bird*, and hath exceeding white flesh.
34. The *Ring-Doves* are of the longest sort of livers, insomuch that they attain sometimes to fifty years of age: an airy *Bird*, and both builds and sits on high. But *Doves* and *Turtles* are but short-liv'd, not exceeding eight years.
35. But *Pheasants* and *Partiges* may live to sixteen years. They are great breeders, but not so white of flesh as the ordinary *Pullen*.

The *Black bird* is reported to be, amongst the lesser birds, one of the longest livers; an unhappy bird, and a good singer. 36.

The *Sparrow* is noted to be of a very short life; and it is imputed in the Males to their lasciviousness. But the *Linnet*, no bigger in body than the *Sparrow*, hath been observed to have lived twenty years. 37.

Of the *Estrich* we have nothing certain: those that were kept here have been unfortunate, that no long life appeared by them. Of the bird *Ibis* we find onely that he liveth long, but his years are not recorded. 38.

The age of *Fishes* is more uncertain than that of terrestrial Creatures, because living under the water they are the less observed: many of them breath not, by which means their vital spirit is more closed in; and therefore though they receive some refrigeration by their Gills, yet that refrigeration is not so continual as when it is by breathing. 39.

They are free from the *Dessiccation* and *Depredation* of the *Air ambient*, because they live in the water: yet there is no doubt but the *water ambient*, and piercing, and received into the pores of the body, doth more hurt to long life than the Air doth. 40.

It is affirmed too that their blood is not warm. Some of them are great devourers, even of their own kind. Their flesh is softer and more tender than that of terrestrial creatures: they grow exceedingly fat, insomuch that an incredible quantity of Oyl will be extracted out of one *Whale*. 41.

Dolphins are reported to live about thirty years; of which thing a trial was taken in some of them by cutting off their tails: they grow untill ten years of age. 42.

That which they report of some *Fishes* is strange, that after a certain age their bodies will waste and grow very slender, onely their head and tail retaining their former greatness. 43.

There were found in *Cæsar's* Fish ponds *Lampreys* to have lived threescore years: they were grown so familiar with long use, that *crassus* the Orator solemnly lamented one of them. 44.

The *Pike* amongst Fishes living in fresh water is found to last longest, sometimes to forty years: he is a Ravener, of a flesh somewhat dry and firm. 45.

But the *Carp*, *Bream*, *Tench*, *Eel*, and the like, are not held to live above ten years. 46.

Salmons are quick of growth, short of life; so are *Trouts*: but the *Pearch* is slow of growth, long of life. 47.

Touching that monstrous bulk of the *Whale* or *Ork*, how long it is weiled by vital spirit, we have received nothing certain; neither yet touching the *Sea-calf*, and *Sea-hog*, and other innumerable *Fishes*. 48.

Crocodiles are reported to be exceeding long-liv'd, and are famous for the time of their growth, for that they, amongst all other Creatures, are thought to grow during their whole life. They are of those Creatures that lay Eggs, ravenous, cruel, and well-fenced against the waters, Touching the other kinds of *shell-fish*, we find nothing certain how long they live: 49.

Observations.

TO find out a Rule touching Length and Shortness of Life in Living Creatures is very difficult, by reason of the negligence of Observations, and the intermixing of Causes. A few things we will set down.

There are more kinds of Birds found to be long liv'd than of Beasts; as the Eagle, the Vulture, the Kite, the Pelican, the Raven, the Crow, the Swan, the Goose, the Stork, the Crane, the Bird called the Ibis, the Parrot, the Ring dove, with the rest, though they come to their full growth within a year, and are less of bodies: surely their cloathing is excellent good against the distemperatures of the weather; and besides, living for the most part in the open Air, they are like the Inhabitants of pure Mountains, which are long-liv'd. Again, their Motion, which (as I else-where said) is a mixt Motion, compounded of a moving of their Limbs and of a carriage in the Air, doth less weary and wear them, and 'tis more wholesome. Neither do they suffer any compression or want of nourishment in their mother's bellies, because the Eggs are laid by turns. But the chiefest cause of all I take to be this; that Birds are made more of the substance of the Mother than of the Father, whereby their Spirits are not so eager and hot. 1.

2. *It may be a Position, that Creatures which partake more of the substance of their Mother than of their Father are longer-liv'd, as Birds are; which was said before. Also that those which have a longer time of bearing in the womb, do partake more of the substance of their Mother, less of the Father, and so are longer-liv'd: Insomuch that I am of opinion, that even amongst Men, (which I have noted in some) those that resemble their Mothers most are longest-liv'd; and so are the Children of Old men begotten of young Wives, if the Fathers be sound, not diseased.*
3. *The first breeding of Creatures is ever material, either to their hurt or benefit. And therefore it stands with reason, that the lesser Compression, and the more liberal Alimentation of the Young one in the womb, should confer much to Long Life. Now this happens when either the young ones are brought forth successively, as in Birds; or when they are single Births, as in Creatures bearing but one at a Birth.*
4. *But long Bearing in the Womb makes for Length of Life three ways. First, for that the young one partakes more of the substance of the Mother, as hath been said. Secondly, that it comes forth more strong and able. Thirdly, that it undergoes the predatory force of the Air later. Besides, it shows that Nature intendeth to finish her periods by larger Circles. Now though Oxen and Sheep, which are born in the womb about six months, are but short-liv'd, that happens for other causes.*
5. *Feeders upon Grass and mere Herbs are but short livers; and Creatures feeding upon Flesh, or Seeds, or Fruits, long livers, as some Birds are. As for Harts, which are long-liv'd, they take the one half of their meat (as men use to say) from above their heads; and the Goose, besides Grass, findeth something in the water, and stubble to feed upon.*
6. *We suppose that a good Cloathing of the Body maketh much to long life; for it fenceth and armeth against the intemperances of the Air, which do wonderfully assail and decay the body: which benefit Birds especially have. Now that Sheep, which have so good Fleeces, should be so short-liv'd, that is to be imputed to Diseases, whereof that Creature is full, and to the bare eating of Grass.*
7. *The seat of the Spirits, without doubt, is principally the Head; which though it be usually understood of the Animal Spirits onely, yet this is all in all. Again, it is not to be doubted but the Spirits do most of all waste and prey upon the Body, so that when they are either in greater plenty, or in greater Inflammation and Acrimony, there the life is much shortned. And therefore I conceive a great cause of long life in Birds to be the smallness of their Heads in comparison of their Bodies; for even Men which have very great Heads I suppose to be the shorter livers.*
8. *I am of opinion that Carriage is of all other motions the most helpful to long life; which I also noted before. Now there are carried Water-fowls upon the water, as Swans; all Birds in their flying, but with a strong endeavour of their limbs; and Fishes, of the length of whose live we have no certainty.*
9. *Those Creatures which are long before they come to their perfection (not speaking of growth in stature onely, but of other steps to maturity; as Man puts forth, first, his Teeth, next the signs of Puberty, then his beard, and so forward) are long liv'd, for it shows that Nature finished her Periods by larger Circles,*
10. *Milder Creatures are not long-liv'd, as the Sheep and Dove; for Choler is as the whetstone and Spur to many Functions in the Body.*
11. *Creatures whose Flesh is more dusky is a longer-liv'd than those that have white Flesh; for it sheweth that the juice of the body is more firm, and less apt to dissipate.*
12. *In every corruptible Body Quantity maketh much to the conservation of the whole: for a great Fire is longer in quenching, a small portion of Water is sooner evaporated, the Body of a Tree withereth not so fast as a Twig. And therefore generally (I speak it of Species, not of Individuals) Creatures that are large in body are longer-liv'd than those that are small, unless there be some other potent cause to hinder it.*

Alimentation, or Nourishment: and the way of Nourishing.

The History.

Nourishment ought to be of an inferiour nature, and more simple substance than the thing nourished. *Plants* are nourished with the Earth and Water, *Living Creatures* with *Plants*, *Man* with living *Creatures*. There are also certain *Creatures* feeding upon *Flesh*, and *Man* himself takes *Plants* into a part of his *Nourishment*; but *Man* and *Creatures* feeding upon *Flesh* are scarcely nourished with *Plants* alone: perhaps *Fruit* or *Grains*, baked or boiled, may, with long use, nourish them; but *Leaves* or *Plants* or *Herbs* will not do it, as the *Order* of the *Foetians* shewed by *Experience*.

Over-great *Affinity* or *Consubstantiality* of the *Nourishment* to the thing nourished proveth not well: *Creatures* feeding upon *Herbs* touch no *Flesh*; and of *Creatures* feeding upon *Flesh*, few of them eat their own kind: As for *Men*, which are *Cannibals*, they feed not ordinarily upon *Men's* flesh, but reserve it as a *Dainty*, either to serve their reveng upon their enemies, or to satisfie their appetite at some times. So the *Ground* is best sown with *Seed* growing elsewhere, and *Men* do not use to *Graft* or *Inoculate* upon the same *Stock*.

By how much the more the *Nourishment* is better prepared, and approacheth nearer in likeness to the thing nourished, by so much the more are *Plants* more fruitful, and *living Creatures* in better liking and plight: for a young *Slip* or *cion* is not so well nourished if it be pricked into the ground, as if it be grafted into a *Stock* agreeing with it in *Nature*, and where it finds the nourishment already digested and prepared: neither (as is reported, will the *Seed* of an *Onion*, or some such like, sown in the bare earth, bring forth so large a fruit as if it be put into another *Onion*, which is a new kind of *Grafting*, into the root, or under ground. Again, it hath been found out lately, that a *Slip* of a *Wild Tree*, as of an *Elm*, *Oak*, *Ash*, or such like, grafted into a *Stock* of the same kind, will bring forth larger leaves than those that grow without grafting: Also *Men* are not nourished so well with raw flesh as with that which hath passed the fire.

Living Creatures are nourished by the *Mouth*, *Plants* by the *Root*, *Young ones* in the womb by the *Navel*: *Birds* for a while are nourished with the *Yolk* in the *EGGE*, whereof some is found in their *Crops* after they are hatched.

All *Nourishment* moveth from the *centre* to the *Circumference*, or from the *Inward* to the outward: yet it is to be noted, that in *Trees* and *Plants* the *Nourishment* passeth rather by the *Bark* and *Outward* parts than by the *Pith* and *Inward* parts; for if the *Bark* be pilled off, though but for a small breadth, round, they live no more: and the *Blood* in the *Veins* of living *Creatures* doth no less nourish the *Flesh* beneath it than the *Flesh* above it.

In all *Alimentation* or *Nourishment* there is a two-fold *Action*, *Extusion* and *Attraction*; whereof the former proceeds from the *Inward* Function, the latter from the *Outward*.

Vegetables assimilate their *Nourishment* simply, without *Excerning*: For *Gums* and *Tears* of *Trees* are rather *Exuberances* than *Excrements*, and *Knots* or *knobs* are nothing but *Diseases*. But the substance of living *Creatures* is more perceptible of the like; and therefore it is conjoyned with a kind of *disdain*, whereby it rejecteth the bad, and assimilateth the good.

It is a strange thing of the *stalks* of *Fruits*, that all the *Nourishment* which produceth sometimes such great *Fruits*, should be forced to pass through so narrow necks; for the *Fruit* is never joyn'd to the *Stock* without some *stalk*.

It is to be noted, that the *Seeds* of living *Creatures* will not be fruitful but when they are new shed, but the *Seeds* of *Plants* will be fruitful a long time after they are gathered; yet the *Slips* or *Cions* of *Trees* will not grow unless they be grafted green; neither will the roots keep long fresh unless they be covered with earth.

In living *creatures* there are degrees of *Nourishment* according to their *Age*: in the womb, the young one is nourished with the *Mother's* blood; when it is new-born, with *Milk*; afterwards with *Meats* and *Drinks*; and in old age the most nourishing and favoury *Meats* please best.

Above all it maketh to the present *Inquisition*, to inquire diligently and attentively whether a man may not receive *Nourishment* from without, at least some other way beside the Mouth. We know that Baths of Milk are used in some *Hectick Fevers*, and when the body is brought extream low, and *Physicians* do provide *Nourishing clysters*. This matter would be well studied; for if *Nourishment* may be made either from without, or some other way than by the stomach, then the weakness of Concoction, which is incident to oldmen, might be recompenced by these helps, and Concoction restored to them intire.

Length and Shortness of Life in Man.

The History.

To the 5, 6,
7, 8, 9, and
II Articles.

I.

BEfore the *Floud*, as the *Sacred Scriptures* relate, *Men* lived many hundred years; yet none of the *Fathers* attained to a full thousand. Neither was this *Length of Life* peculiar onely to *Grace*, or the *Holy Line*; for there are reckoned of the *Fathers* until the *Floud* eleven Generations; but of the sons of *Adam* by *Cain* onely eight Generations; so as the posterity of *Cain* may seem the longer-liv'd. But this *Length of Life* immediately after the *Floud* was reduced to a moiety, but in the *Post-nati*; for *Noah*, who was born before, equalled the age of his Ancestors, and *Sem* saw the six hundredth year of his life. Afterwards, three Generations being run from the *Floud*, the *Life of Man* was brought down to a fourth part of the primitive *Age*, that was, to about two hundred years.

2.

Abraham lived an hundred seventy and five years: a man of an high courage, and prosperous in all things. *Isaac* came to an hundred and eighty years of age: a chaste man, and enjoying more quietness than his Father. But *Jacob*, after many crosses and a numerous progeny, lasted to the hundred forty seventh year of his life: a patient, gentle, and wise man. *Ismael*, a military man, lived an hundred thirty and seven years. *Sarah* (whose years onely amongst women are recorded) died in the hundred twenty seventh year of her age: a beautifull and magnanimous woman; a singular good Mother and Wife; and yet no less famous for her Liberty than Obsequiousness towards her husband. *Joseph* also, a prudent and politick man, passing his youth in affliction, afterwards advanced to the height of honour and prosperity, lived an hundred and ten years. But his brother *Levi*, elder than himself, attained to an hundred thirty seven years: a man impatient of contumely and revengeful. Near unto the same age attained the son of *Levi*; also his *grand-child*, the father of *Aaron* and *Moses*.

3.

Moses lived an hundred and twenty years: a stout man, and yet the meekest upon the earth, and of a very slow tongue. Howsoever *Moses* in his *Psalm* pronounceth that the life of man is but seventy years, and if a man have strength, then eighty; which term of man's life standeth firm in many particulars even at this day. *Aaron*, who was three years the elder, died the same year with his Brother: a man of a readier speech, of a more facile disposition, and less constant. But *Phineas*, *grand-child* of *Aaron*, (perhaps out of extraordinary grace) may be collected to have lived three hundred years; if so be the *War* of the *Israelites* against the Tribe of *Benjamin* (in which Expedition *Phineas* was consulted with) were performed in the same order of time in which the *History* hath ranked it: He was a man of a most eminent Zeal. *Joshua*, a martial man, and an excellent Leader, and evermore victorious, lived to the hundred and tenth year of his life. *Caleb* was his Contemporary, and seemeth to have been of as great years. *Ehud* the Judge seems to have been no less than an hundred years old, in regard that after the Victory over the *Moabites* the *Holy Land* had rest under his Government eighty years: He was a man fierce and undaunted, and one that in a sort neglected his life for the good of his People.

4.

Job lived, after the restauration of his happiness, an hundred and forty years, being before his afflictions of that age that he had sons at man's estate: a man politick,

litick, eloquent, charitable, and the *Example of Patience*. *Eli* the Priest lived ninety eight years; a corpulent man, calm of disposition, and indulgent to his children. But *Elianus* the Prophet may seem to have died when he was above an hundred years old; for he is found to have lived after the *assumption* of *Elias* sixty years; and at the time of that *assumption* he was of those years, that the boys mocked him by the name of *Bald-head*: a man vehement and severe, and of an austere life, and a contemner of riches. Also *Isaiab* the Prophet seemeth to have been an hundred years old: for he is found to have exercised the Function of a Prophet seventy years together, the years both of his beginning to prophesie and of his death being uncertain: a man of an admirable eloquence, an *Evangelical Prophet*, full of the promises of God of the *New Testament*, as a Bottle with sweet Wine.

Tobias the Elder lived an hundred fifty eight years, the Younger, an hundred twenty seven: merciful men, and great alms-givers. It seems, in the time of the *Captivity*, many of the *Jews* who returned out of *Babylon* were of great years, seeing they could remember both *Temples*, (there being no less than seventy years betwixt them) and wept for the unlikeliness of them. Many ages after that, in the time of our *Saviour*, lived old *Simcon*, to the age of ninety; a devout man, and full both of hope and expectation. Into the same time also fell *Anna* the *Prophets*, who could not possibly be less than an hundred years old; for she had been seven years a wife, about eighty four years a widow, besides the years of her virginity, and the time that she lived after her Prophecy of our *Saviour*: She was an holy woman, and passed her days in fastings and prayers.

The *long Lives* of *Men* mentioned in *Heathen Authors* have no great certainty in them; both for the intermixture of Fables, whereunto those kind of relations were very prone, and for their false calculation of years. Certainly of the *Aegyptians* we find nothing of moment in those works that are extant as touching *long Life*, for their *Kings* which reigned longest did not exceed fifty or five and fifty years, which is no great matter, seeing many at this day attain to those years. But the *Arcadian Kings* are fabulously reported to have lived very long. Surely that Country was Mountainous, full of flocks of Sheep, and brought forth most wholesome food; notwithstanding, seeing *Pan* was their god, we may conceive that all things about them were *Panick* and vain, and subject to fables.

Numa King of the *Romans* lived to eighty years: a man peaceable, contemplative, and much devoted to Religion. *Marcus Valerius Corvinus* saw an hundred years complete, there being betwixt his first and sixth *Consulship* forty six years: a man valorous, affable, popular, and always fortunate.

Solon of *Athens*, the *Law giver*, and one of the seven *wise-men* lived above eighty years: a man of an high courage, but popular, and affected to his Country; also learned, given to pleasures and a soft kind of life. *Epimenides* the *Cretian* is reported to have lived an hundred fifty seven years: the matter is mix'd with a *prodigious Relation*; for fifty seven of those years he is said to have slept in a *Cave*. Half an age after *Xenophon* the *Colophonian* lived an hundred and two years, or rather more: for at the age of twenty five years he left his Country, seventy seven complete years he travelled, and after that returned; but how long he lived after his return appears not; a man no less wandering in mind than in body, for his name was changed for the madness of his opinions from *Xenophanes* to *Xenomanes*: a man no doubt of a vast conceit, and that minded nothing but *Infinitum*.

Anacreon the Poet lived eighty years and somewhat better: a man lascivious, voluptuous, and given to drink. *Pindarus* the *Theban* lived to eighty years: a Poet of an high fancy, singular in his conceits, and a great adorer of the gods. *Sophocles* the *Athenian* attained to the like age: a lofty Tragick Poet, given over wholly to Writing, and neglectful of his Family.

Artaxerxes King of *Persia* lived ninety four years: a man of a dull wit, averse to the dispatch of business, desirous of glory, but rather of ease. At the same time lived *Agelilaus* King of *Sparta* to eighty four years of age: a moderate Prince, as being a *Philosopher* among *Kings*; but notwithstanding ambitious, and a Warriour, and no less stout in war than in business.

Gorgias the *Sicilian* was an hundred and eight years old; a *Rhetorician*, and a great boaster of his faculty, one that taught Youth for profit: he had seen many Countries.

Countries, and a little before his death said, That he had done nothing worthy of blame since he was an old man. *Protagoras* of *Sabera* sa ninety years of age: this man was likewise a *Rhetorician*, but professed not so much to teach the Liberal Arts, as the Art of Governing Common-wealths and States: notwithstanding he was a great wanderer in the world, no less than *Gorgias*. *Iocrates* the *Athenian* lived ninety eight years: he was a *Rhetorician* also, but an exceeding modest man; one that shunned the publick light, and opened his School onely in his own house. *Democritus* of *Abdera* reached to an hundred and nine years: he was a great *Philosopher*, and, if ever any man amongst the *Grecians*, a true *Naturalist*; a Surveyor of many Countries, but much more of Nature; also a diligent searcher into Experiments, and (as *Aristotle* objected against him) one that followed Similitudes more than the Laws of Arguments. *Diogenes* the *Sisropean* lived ninety years: a man that used liberty towards others, but tyranny over himself: a course diet, and of much patience. *Zeno* of *Citium* lacked but two years of an hundred: a man of an high mind, and a contemner of other mens opinions; also of a great acuteness, but yet not troublesome, chusing rather to take mens minds than to enforce them: The like whereof afterward was in *Seneca*. *Plato* the *Athenian* attained to eighty one years: a man of a great courage, but yet a lover of ease; in his Notions sublimed, and of a fancy, neat and delicate in his life, rather calm than merry, and one that carried a kind of Majesty in his countenance. *Theophrastus* the *Eressian* arrived at eighty five years of age; a man sweet for his eloquence, sweet for the variety of his matters, and who selected the pleasant things of Philosophy, and let the bitter and harsh go. *Carneades* of *Cyrene* many years after came to the like age of eighty five years: a man of a fluent eloquence, and one who by the acceptable and pleasant variety of his knowledge delighted both himself and others. But *Orbilus*, who lived in *Cicero's* time, no *Philosopher* or *Rhetorician*, but a *Grammarians*, attained to an hundred years of age, he was first a Souldier, then a Schoolmaster; a man by nature tart both in his Tongue and Pen, and severe towards his Scholars.

12.

Quintus Fabius Maximus was *Augur* sixty three years, which shewed him to be above eighty years of age at his death; though it be true, that in the *Augurship* Nobility was more respected then age: a wise man, and a great *Deliberator*, and in all his proceedings moderate, and not without affability severe. *Masmissa* King of *Nu-midia* lived ninety years, and being more than eighty five got a son: a daring man, and trusting upon his fortune, who in his youth had tasted of the inconstancy of Fortune, but in his succeeding age was constantly happy. But *Marcus Porcius Cato* lived above ninety years of age: a man of an Iron body and mind; he had a bitter tongue, and loved to cherish factions; he was given to Husbandry, and was to himself and his Family a Physician.

13.

Terentia Cicero's wife, lived an hundred and three years: a woman afflicted with many crosses; first, with the banishment of her Husband; then with the difference betwixt them; lastly, with his last fatal misfortune: She was also oftentimes vexed with the *Gout*. *Luceia* must needs exceed an hundred by many years; for it is said that she acted an whole hundred years upon the Stage, at first perhaps representing the person of some young Girl, at last of some decrepit old Woman. But *Galeria Copiola*, a Player also and a Dancer, was brought upon the Stage as a Novice, in what year of her age is not known; but ninety nine years after, at the Dedication of the Theatre by *Pompey the Great*, she was shewn upon the Stage, not now for an Actress, but for a Wonder: neither was this all, for after that, in the Solemnities for the health and life of *Augustus*, she was shewn upon the Stage the third time.

14.

There was another Actress, somewhat inferiour in age, but much superiour in dignity, which lived well-near ninety years, I mean *Livia Julia Augusta*, wife to *Augustus Caesar*, and mother to *Tiberius*. For if *Augustus* his life were a Play, (as himself would have it, whenas upon his death-bed he charged his friends they should give him a *Plaudite* after he was dead) certainly this Lady was an excellent Actress, who could carry it so well with her husband by a dissembled obedience, and with her son by power and authority: a woman affable, and yet of a Matronal carriage, pragmatical, and upholding her power. But *Junia*, the wife of *Caius Cassius*, and sister of *Marcus Brutus*, was also ninety years old; for she survived the *Philippick Battel* sixty four years: a magnanimous woman, in her great wealth happy;

happy in the calamity of her husband and near kinsfolks, and in a long widow-hood unhappy; notwithstanding much honoured of all.

The year of our Lord seventy six, falling into the time of *Vespasian*, is memorable; in which we shall find, as it were, a calendar of long-liv'd men: For that year there was a *Taxing*, (now a *Taxing* is the most Authentical and truest Informer touching the ages of men;) and in that part of *Italy* which lieth betwixt the *Apennine Mountains* and the *River Po*, there were found an hundred and four and twenty persons that either equalled or exceeded an hundred years of age: namely, of an hundred years just, fifty four persons; of an hundred and ten, fifty seven persons; of an hundred and five and twenty, two onely; of an hundred and thirty, four men; of an hundred and five and thirty, or seven and thirty, four more; of an hundred and forty, three men. Besides these, *Parma* in particular afforded five; whereof three fulfilled an hundred and twenty years, and two an hundred and thirty: *Bruxels* afforded one of an hundred and twenty five years old; *Placentia* one, aged an hundred thirty and one; *Faventia* one woman, aged one hundred thirty and two: a certain Town, then called *Velleiatium*, situate in the Hills about *Placentia*, afforded ten, whereof six fulfilled an hundred and ten years of age; four, an hundred and twenty: Lastly, *Rimini* one of an hundred and fifty years, whose name was *Marcus Aponius*.

15.

That our catalogue might not be extended too much in length, we have thought fit, as well in those whom we have rehearsed, as in those whom we shall rehearse, to offer none under eighty years of age. Now we have affixed to every one a true and short Character or Elogy; but of that sort whereunto, in our judgment, Length of Life (which is not a little subject to the Manners and Fortunes of men) hath some relation, and that in a two-fold respect: either that such kind of men are for the most part long-liv'd; or that such men may sometimes be of long life, though otherwise not well disposed for it.

Amongst the Roman and Grecian Emperors, also the French and *Almain*, to these our dayes, which make up the number of well-near two hundred Princes, there are onely four found that lived to eighty years of age: unto whom we may adde the two first Emperors, *Augustus* and *Tiberius*; whereof the latter fulfilled the seventy and eighth year, the former the seventy and sixth year of his age, and might both perhaps have lived to fourscore, if *Livia* and *Caius* had been pleased. *Augustus* (as was said) lived seventy and six years: a man of moderate disposition; in accomplishing his designs vehement, but otherwise calm and serene; in meat and drink sober, in Venery intemperate, through all his life-time happy; and who about the thirtieth year of his life had a great and dangerous sickness, insomuch as they despaired of life in him; whom *Antonius Musa* the Physician, when other Physicians had applied hot Medicines, as most agreeable to his disease, on the contrar, cured with cold Medicines, which perchance might be some help to the prolonging of his life. *Tiberius* lived to be two years older: A man with lean chops; as *Augustus* was wont to say, for his speech stuck within his jaws, but was weighty. He was bloody, a drinker, and one that took Lust into a part of his diet; notwithstanding a great observer of his health, insomuch that he used to say, That he was a fool that after thirty years of age took advice of a Physician. *Gordian* the elder lived eighty years, and yet died a violent death when he was scarce warm in his Empire: a man of an high spirit and renowned, learned, and a Poet, and constantly happy throughout the whole course of his life, save onely that he ended his dayes by a violent death. *Valerian* the Emperour was seventy six years of age before he was taken prisoner by *Sapor* King of *Persia*, after his Captivity he lived seven years in reproaches; and then died a violent death also: a man of a poor mind, and not valiant; notwithstanding lifted up in his own and the opinion of men; but falling short in the performance. *Anastasius*, surnamed *Dicorus*, lived eighty eight years: he was of a settled mind, but too abject, and superstitious; and fearful. *Anicius Justinianus* lived to eighty three years: a man greedy of glory, performing nothing in his own person, but in the valour of his Captains happy and renowned; uxorious, and not his own man, but suffering others to lead him. *Helena* of *Britain*, mother of *Constantine* the Great, was fourscore years old: a woman that intermeddled not in matters of State neither in her Husband's nor sons Reign, but devoted her self wholly to Religion; magnanimous, and perpetually flourishing. *Theodora* the Empress (who was sister to *Zoes*, wife

16.

wife of *Monomachus*, and reigned alone after her decease) lived above eighty years: a pragmatistical woman, and one that took delight in Governing; fortunate in the highest degree, and through her good fortunes credulous,

17.

We will proceed now from these *Secular Princes* to the *Princes* in the *Church*. St. *John*, an Apostle of our saviour, and the *Beloved Disciple*, lived ninety three years. He was rightly denoted under the *Emblem* of the *Eagle*, for his piercing sight into the *Divinity*; and was a *seraph* amongst the *Apostles* in respect of his burning Love. St. *Luke* the *Evangelist* fulfilled fourscore and four years: an eloquent man, and a Traveller, St. *Paul's* inseparable Companion, and a *Physician*; *Simeon* the son of *Cleophas*, called the *Brother of our Lord*, and Bishop of *Jerusalem*, lived an hundred and twenty years though he was cut short by Martyrdom: a stout man, and constant, and full of good works. *Polycarpus*, Disciple unto the *Apostles*, and Bishop of *Smyrna*, seemeth to have extended his age to an hundred years and more; though he were also cut off by Martyrdom: a man of an high mind, of an heroi- cal patience, and unwearied with labours. *Dionysius Areopagita*, Contemporary to the Apostle St. *Paul*, lived ninety years: he was called the *Bird of Heaven* for his high flying *Divinity*, and was famous as well for his holy life as for his Meditations. *Aquila* and *Priscilla*, first St. *Paul* the Apostle's Hosts. Afterward his Fellow-helpers, lived together in a happy and famous Wedlock at least to an hundred years of age a piece; for they were both alive under Pope *Xistus* the first: a noble Pair, and prone to all kind of charity, who amongst other their comforts (which no doubt were great unto the first *Founders* of the *Church*) had this added, to enjoy each other so long in an happy marriage. St. *Paul* the *Hermite* lived an hundred and thirteen years: now he lived in a Cave; his diet was so slender and strict, that it was thought almost impossible to support humane nature there- withal: he passed his years onely in Meditations and Soliloquies; yet he was not illiterate or an Idiot, but learned. St. *Anthony*, the first Founder of *Monks*, or (as some will have it) the Restorer onely, attained to an hundred and five years of age: a man devout and contemplative, though not unfit for Civil affairs: his life was austere and mortifying, notwithstanding he lived in a kind of glorious soli- tude; and exercised a command, for he had his *Monks* under him. And besides, many *Christians* and *Philosophers* came to visit him as a living Image, from which they parted not without some adoration. St. *Athanasius* exceeded the term of eighty years: a man of an invincible constancy, commanding fame, and not yielding to Fortune: he was free towards the Great ones, with the People gracious and acceptable, beaten and practised to oppositions, and in delivering himself from them stout and wise. St. *Hierom*, by the consent of most Writers, exceeded ninety years of age: a man powerful in his Pen, and of a manly Eloquence, variously learned both in the Tongues and Sciences, also a Traveller, and that lived strictly towards his old age, in an estate private, and not dignified; he bore high Spirits, and shined far out of obscurity.

18.

The *Popes of Rome* are in number to this day two hundred forty and one. Of so great a number five onely have attained to the age of fourscore years, or upwards. But in many of the first *Popes* their full age was intercepted by the Prerogative and Crown of *Martyrdom*. *John* the twenty third, *Pope of Rome*, fulfilled the ninetieth year of his age: a man of an unquiet disposition, and one that studied novelty: he altered many things, some to the better, others onely to the new, a great accumulator of Riches and Treasures. *Gregory*, called the twelfth, created in Schism, and not fully acknow- ledged *Pope*, died in ninety years: of him, in respect of his short *Papacy*, we find nothing to make a judgment upon. *Paul* the third lived eighty years and one: a tempe- rate man, and of a profound wisdom: he was Learned, an Astrologer, and one that tended his health carefully; but, after the example of old *Eli* the Priest, over-indulgent to his Family. *Paul* the fourth attained to the age of eighty three years: a man of an harsh nature and severe, of an haughty mind and imperious, prone to anger; his speech was eloquent and ready. *Gregory* the thirteenth fulfilled the like age of eighty three years: an absolute good man, sound in mind and body, politick, temperate, full of good works, and an alms-giver.

19.

Those that follow are to be more promiscuous in their order, more doubtful in their faith, and more barren of observation. King *Argamthenius*, who reigned at *Cadix* in

pain,

Spain lived an hundred and thirty, or (as some would have it) an hundred and forty years, of which he reigned eighty. Concerning his Manners, Institution of his Life, and the time wherein he reigned, there is a general silence. *Cyprus* King of *Cyprus*, living in the *Island* then termed the *Happy and Pleasant Island*, is affirmed to have attained to an hundred and fifty or sixty years. Two *Latin Kings* in *Italy*, the *Father* and the *Son*, are reported to have lived, the one eight hundred, the other six hundred years: but this is delivered unto us by certain *Philologists*, who though otherwise credulous enough, yet themselves have suspected the truth of this matter, or rather condemned it. Others record some *Arcadian Kings* to have lived three hundred years: the *Country*, no doubt, is a place apt for long life; but the *Relation* I suspect to be fabulous. They tell of one *Dando* in *Illyrium*, that lived without the inconveniences of old age to five hundred years. They tell also of the *Epians*, a part of *Aetolia*, that the whole *Nation* of them were exceeding long liv'd, insomuch that many of them were two hundred years old; and that one principal man amongst them, named *Livorius*, a man of a *Giant-like* stature, could have told three hundred years. It is recorded, that on the top of the *Mountain Timolus*, anciently called *Tempsis*, many of the *Inhabitants* lived to an hundred and fifty years. We read that the *Seēt* of the *Essēans* amongst the *Jews* did usually extend their life to an hundred years: Now that *Seēt* used a single or abstemious diet, after the rule of *Pythagoras*. *Apollonius Tyaneus* exceeded an hundred years, his face bewraying no such age: he was an admirable man, of the *Heathens* reputed to have something *Divine* in him, of the *Christians* held for a *Sorcerer*; in his diet *Pythagorical*, a great traveller, much renowned, and by some adored as a *god*: notwithstanding, towards the end of his life he was subject to many complaints against him, and reproaches, all which he made shift to escape. But lest his long life should be imputed to his *Pythagorical* diet, and not rather that it was hereditary, his *Grandfather* before him lived an hundred and thirty years. It is undoubted that *Quintus Metellus* lived above an hundred years, and that after several *Consulships* happily administr'd, in his old age he was made *Pontifex Maximus*, and exercised those holy duties full two and twenty years; in the performance of which *Rites* his voice never failed, nor his hand trembled. It is most certain that *Appius cecus* was very old, but his years are not extant; the most part whereof he pass'd after he was blind; yet this misfortune no whit softned him, but that he was able to govern a numerous *Family*, a great *Retinue* and *Dependance*, yea, even the *Commonwealth* it self, with great stoutness. In his extream old age he was brought in a *Litter* into the *senate-house*, and vehemently dissuaded the *Peace* with *Pyrrhus*: the beginning of his *Oration* was very memorable, shewing an invincible spirit and strength of mind; *I have with great grief of mind (Fathers conscript) these many years born my blindness, but now I could wish that I were deaf also, when I hear you speak to such dishonourable Treaties.* *Marcus Perpenna* lived ninety eight years, surviving all those whose *Suffrages* he had gathered in the *senate-house*, being *Consul*, I mean, all the *Senators* at that time; as also all those whom a little after, being *Consul*, he chose into the *Senate*, seven onely being excepted. *Hiero* King of *Sicily*, in the time of the second *Punick War*, lived almost an hundred years: a man moderate both in his *Government* and in his *Life*; a worshiper of the *gods*, and a religious conserver of *Friendship*: liberal, and constantly fortunate. *Statilia*, descended of a noble *Family* in the days of *Claudius*, lived ninety nine years. *Clodia*, the daughter of *Osilius*, an hundred and fifteen. *Xenophilus*, an ancient *Philosopher*, of the *Seēt* of *Pythagoras*, attained to an hundred and six years, remaining healthful and vigorous in his old age, and famous amongst the vulgar for his learning. The *Islanders* of *Corcyra* were anciently accounted long liv'd, but now they live after the rate of other men, *Hipocrates Cou*, the famous *Physician*, lived an hundred and four years, and approved and credited his own *Art* by so long a life: a man that coupled *Learning* and *Wisdom* together, very conversant in *Experience* and *Observation*; one that haunted not after *Words* or *Methods*, but severed the very *Nerves* of *Science*, and so propounded them. *Demonax* a *Philosopher*, not onely in *Profession* but *Practice*, lived in the dayes of *Adrian* almost to an hundred years: a man of an high mind, and a vanquisher of his own mind, and that truly and without affectation; a contemner of the world, and yet civil and courteous. When his friends spake to him about his *Burial*, he said, *Take no care for my Burial, for Stench will bury a Carcase.* They replied, *Is it your*

mind than to be cast out to Birds and Dogs? He said again, *Seeing in my life-time I endeavoured to my uttermost to benefit Men, what hurt is it if when I am dead I benefit Beasts?* Certain Indian People called *Pandora* are exceedingly long-liv'd, even to no less than two hundred years: They adde a thing more marvellous, That having, when they are boys, an hair somewhat whitish, in their old age, before their gray hairs, they grow coal black, though indeed this be every where to be seen, that they which have white hair whilst they are boys, in their man's estate change their hairs into a darker colour. The *Seres*, another people of *India*, with their Wine of Palms are accounted long-livers, even to an hundred and thirty years. *Euphranor* the *Grammarian* grew old in his School, and taught Scholars when he was above an hundred years old. The elder *Ovid*, father to the *Poet*, lived ninety years, differing much from the disposition of his son, for he contemned the *Muses*, and dissuaded his son from Poetry. *Asinius Pollio*, intimate with *Augustus*, exceeded the age of an hundred years: a man of an unreasonable Profuseness, Eloquent, and a lover of Learning; but vehement, proud, cruel, and one that made his private ends the centre of his thoughts. There was an opinion, that *Seneca* was an extreame old man, no less than an hundred and fourteen years of age: which could not possibly be, it being as improbable that a decrepit old man should be set over *Nero's* Youth, as, on the contrary, it was true, that he was able to manage with great dexterity the affairs of State: besides, a little before, in the midst of *Claudius* his Reign, he was banished *Rome* for Adulteries committed with some *Noble Ladies*, which was a Crime no way competible with so extreme old age. *Johannes de Temporibus*, among all the men of our later Ages, out of a common fame and vulgar opinion, was reputed long-liv'd, even to a miracle, or rather, even to a fable; his age hath been counted above three hundred years: He was by Nation a *French-man*, and followed the Wars under *Charls* the *Great*. *Garcius Aretine*, Great Grand-father to *Petrarch*, arrived at the age of an hundred and four years: he had ever enjoyed the benefit of good health; besides, at the last, he felt rather a decay of his strength, than any sickness or malady, which is the true resolution by old age. Amongst the *Venetsians* there have been found not a few long-livers, and those of the more eminent sort: *Franciscus Donatus*, Duke; *Thomas Contarenu*, Procurator of *St. Mark*; *Franciscus Molinus*, Procurator also of *St. Mark*, and others. But most memorable is that of *Cornarus* the *Venetian*, who being in his youth of a sickly body, began first to eat and drink by measure to a certain weight, thereby to recover his health: this Cure turned by use into a Diet, that Diet to an extraordinary long Life, even of an hundred years and better, without any decay in his senses, and with a constant enjoying of his health. In our age *William Postel*, a *French-man*, lived to an hundred and well-nigh twenty years, the top of his beard on the upper-lip being black, and not gray at all: a man crazed in his brain, and of a fancy not altogether sound; a great Traveller, Mathematician, and somewhat stained with *Heresie*.

20. I suppose there is scarce a *Village* with us in *England*, if it be any whit populous, but it affords some Man or Woman of fourscore years of age; nay, a few years since there was in the County of *Hereford* a May-game or Morrice dance, consisting of eight men, whose age computed together made up eight hundred years, insomuch that what some of them wanted of an hundred, others exceeded as much.

21. In the *Hospital* of *Bethlehem*, corruptly called *Bedlam*, in the *Suburbs* of *London*, there are found from time to time many mad persons that live to a great age.

22. The ages of *Nymphs*, *Fauns*, and *Satyrs*, whom they make to be indeed mortal, but yet exceedingly long-liv'd, (a thing which ancient Superstition and the late Credulity of some have admitted) we account but for *Fables* and *Dreams*; especially being that which hath neither consent with *Philosophy* nor with *Divinity*. And as touching the *History* of *Long Life* in *Man* by *Individuals*, or next unto *Individuals*, thus much. Now we will pass on to *Observations* by certain *Heads*.

23. The *Running* on of *Ages*, and *Succession* of *Generations*, seem to have no whit abated from the length of *Life*; for we see that from the time of *Moses* unto these our dayes, the term of man's life hath stood about fourscore years of age, neither hath it declined (as a man would have thought) by little and little. No doubt there are times in every Country wherein men are longer or shorter liv'd.

Longer,

Longer, for the most part when the times are barbarous, and men fare less deliciously, and are more given to bodily exercises: Shorter, when the times are more civil, and men abandon themselves to luxury and ease. But these things pass on by their turns, the succession of Generations alters is not. The same, no doubt, is in other living Creatures; for neither Oxen, nor Horses, nor Sheep, nor any the like, are abridged of their wonted ages at this day. And therefore the Great Abridger of Age was the Flood; and perhaps some such notable accidents (as particular Inundations, long Droughts, Earthquakes, or the like) may do the same again. And the like reason is in the dimension and stature of Bodies; for neither are they lessened by succession of Generations, howsoever Virgil (following the vulgar opinion) divined, that after Ages would bring forth lesser Bodies than the then present: whereupon speaking of ploughing up the *Æmilian* and *Æmonian* Fields, he saith, *Grandiæq; effossis mirabitur ossa sepulchris*, That after-ages shall admire the great bones digged up in ancient sepulchres. For whereas it is manifested that there were heretofore men of Gigantine Statures, (such as for certain have been found in *Sicily*, and else-where, in ancient Sepulchres and Caves) yet within these last three thousand years, a time whereof we have sure memory, those very places have produced none such: although this thing also hath certain turns and changes, by the Civilizing of a Nation, no less than the former. And this is the rather to be noted, because men are wholly carried away with an opinion, that there is a continual decay by Succession of Ages, as well in the term of man's Life as in the stature and strength of his Body; and that all things decline and change to the worse.

In Cold and Northern Countries men live longer commonly than in Hot: which must needs be in respect the skin is more compact and close, and the juices of the body less dissippable, and the Spirits themselves less eager to consume, and in better disposition to repair, and the Air (as being little heated by the Sun-beams) less predatory: And yet under the *Æquinoctial Line*, where the Sun passeth to and fro, and causeth a double Summer and double Winter, and where the Days and Nights are more equal, (if other things be concurring) they live also very long; as in *Peru* and *Taprobane*.

24.

Islanders are, for the most part, longer-liv'd than those that live in Continents: for they live not so long in *Russia* as in the *Orcades*; nor so long in *Africa*, though under the same Parallel, as in the *Canaries* and *Tercera's*; and the *Japonians* are longer-liv'd than the *Chineses*, though the *Chineses* are made upon long life. And this thing is no marvel, seeing the Air of the Sea doth heat and cherish in cooler Regions, and cool in hotter.

25.

High Situations do rather afford long-livers than Low, especially if they be not Tops of Mountains, but Rising Grounds, as to their general Situations; such as was *Arcadia* in *Greece*, and that part of *Ætolia* where we related them to have lived so long. Now there would be the same reason for Mountains themselves, because of the pureness and clearness of the Air, but that they are corrupted by accident, namely, by the Vapours rising thither out of the Valleys, and resting there; and therefore in Snowy Mountains there is not found any notable long life, not in the *Alps*, not in the *Pyrenean Mountains*, not in the *Apennine*: yet in the tops of the Mountains running along towards *Æthiopia* and the *Abyssines*, where by reason of the Sands beneath little or no Vapour riseth to the Mountains, they live long, even at this very day, attaining many times to an hundred and fifty years.

26.

Marshes and Fens are propitious to the Natives, and malignant to Strangers, as touching the lengthning and shortning of their lives: and that which may seem more marvellous, Salt-marshes, where the Sea Ebbs and Flows, are less wholsome than those of Fresh water.

27.

The Countries which have been observed to produce long-livers are these; *Arcadia*, *Ætolia*, *India* on this side *Ganges*, *Brasil*, *Taprobane*, *Britain*, *Ireland*, with the Islands of the *Orcades* and *Hebrides*: for as for *Æthiopia*, which by one of the Ancients is reported to bring forth long Livers, tis but a toy.

28.

It is a Secret; The healthfulness of Air, especially in any perfection, is better found by Experiment than by Discourse or Conjecture. You may make a trial by a lock of Wool exposed for a few dayes in the open Air, if the weight be not much

29.

increas'd ; another by a piece of flesh expos'd likewise, if it corrupt not over-foon ; another by a Weather-glass, if the Water interchange not too suddenly. Of these and the like enquire further.

30. Not onely the *Goodness* or *Pureness* of the *Air*, but also the *Equality* of the *Air*, is material to long life. Intermixture of Hills and Dales is pleasant to the sight, but suspected for long life. A Plain, moderately drie, but yet not over-barren or sandy, nor altogether without Trees and Shade, is very convenient for length of life.

31. *Inequality* of *Air* (as was even now said) in the place of our dwelling is naught ; but *Change* of *Air* by travelling, after one be us'd unto it, is good ; and therefore great Travellers have been long liv'd. Also those that have lived perpetually in a little Cottage, in the same place, have been long-livers : for air accustomed consumeth less ; but air changed nourisheth and repaireth more.

32. As the continuation and number of Successions (which we said before) makes nothing to the Length and Shortness of Life ; so the *immediate condition* of the *Parents*, (as well the Father as the Mother) without doubt availeth much. For some are begotten of old men, some of young men, some of men of middle age ; again, some are begotten of fathers healthful and well-dispos'd, others of diseas'd and languishing ; again, some of fathers immediately after repletion, or when they are drunk, others after sleeping, or in the morning ; again, some after a long intermission of *Venus*, others upon the act repeated ; again, some in the fervency of the father's love, (as it is commonly in Bastards) others after the cooling of it, as in long-married couples. The same things may be considered on the part of the Mother : unto which must be added the condition of the Mother whilst she is with child, as touching her health, as touching her diet, the time of her bearing in the womb, to the tenth month, or earlier. To reduce these things to a Rule, how far they may concern *Long Life*, is hard ; and so much the harder, for that those things which a man would conceive to be the best, will fall out to the contrary : For that alacrity in the Generation which begets lusty and lively children, will be less profitable to long life, because of the Acrimony and inflaming of the Spirits. We said before, That to partake more of the mother's blood conduceth to long life : also we suppose all things in moderation to be best ; rather Conjugal love than Meretricious ; the hour for Generation to be the morning ; a state of body not too lusty or full, and such like. It ought to be well observed, that a strong Constitution in the Parents is rather good for them then for the Child, especially in the Mother : And therefore *Plato* thought, ignorantly enough, that the virtue of Generations halted, because the Woman us'd not the same exercise both of mind and body with the Men. The contrary is rather true ; for the difference of virtue betwixt the Male and the Female is most profitable for the Child ; and the thinner Women yield more towards the nourishment of the Child ; which also holds in Nurfes. Neither did the *Spartan Women*, which married not before twenty two, or, as some say, twenty five, (and therefore were called *Man-like women*) bring forth a more generous or long-liv'd Progeny than the *Roman* or *Athenian*, or *Theban women* did, which were ripe for Marriage at twelve or fourteen years ; and if there were any thing eminent in the *spartans*, that was rather to be imputed to the Parsimony of their Diet than to the late Marriages of their Women. But this we are taught by experience, that there are some Races which are long liv'd for a few Descents ; so that Life is like some Diseases, a thing hereditary within certain bounds.

33. *Fair* in *Face*, or *Skin*, or *Hair*, are shorter livers ; *Black*, or *Red*, or *Freckled*, longer. Also too fresh a colour in Youth doth less promise long life than paleness. A *hard skin* is a sign of long life rather than a *soft* ; but we understand not this of a *rugged skin*, such as they call the *Goose skin*, which is as it were spongy, but of that which is hard and close. A *Fore-head* with deep furrows and wrinkles is a better sign than a smooth and plain *Forehead*.

34. The *Hairs* of the *Head* hard and like bristles, do betoken longer life than those that are soft and delicate. *Curled Hairs* betoken the same thing, if they be hard withal ; but the contrary if they be soft and shining : the like if the *curling* be rather thick than in large bunches.

35. Early or late *Baldness* is an indifferent thing, seeing many which have been

Bald betimes have lived long. Also early *gray hairs* (howsoever they may seem fore-runners of old age approaching) are no sure signs; for many that have grown *gray* betimes have lived to great years: nay, *hasty gray hairs* without *Baldness* is a token of long life; contrarily, if they be accompanied with *Baldness*.

Hairiness of the *upper parts* is a sign of short life, and they that have extraordinary much *hair* on their breasts live not long; but *hairiness* of the *lower parts*, as of the Thighes and Legs, is a sign of long life.

Talness of *Stature* (if it be not immoderate) with convenient making, and not too slender, especially if the body be active withal, is a sign of long life: Also on the contrary, men of low stature live long, if they be not too active and stirring.

In the proportion of the body they which are *short* to the *wastes*, with *long Leggs*, are longer-liv'd than they which are *long* to the *wastes*, and have *short Leggs*: also they which are large in the *neather parts*, and streight in the *upper*, (the making of their body rising, as it were, into a sharp figure) are longer-liv'd than they that have *broad shoulders*, and are slender downwards.

Leanness, where the affections are settled, calm, and peaceable; also a more *fat habit of body*, joynd with *Choler*, and a disposition stirring and peremptory, signifie long life: but *Corpulency* in Youth foreshews short life, in Age it is a thing more indifferent.

To be *long* and *slow* in *growing* is a sign of long life; if to a greater stature, the greater sign, if to a lesser stature, yet a sign though: contrarily, to *grow* quickly to a great stature is an evil sign; if to a small stature, the less evil.

Firm Flesh, a raw-bone body, and veins lying higher than the flesh, betoken long life; the contrary to these, short life.

A *Head* somewhat lesser than to the proportion of the body; a moderate *Neck*, not long, nor slender, nor flat, nor too short; wide *Nostrils*, whatsoever the form of the Nose be; a large *Mouth*; and *Ear* gristly, not fleshy; *Teeth* strong and contiguous, small, or thin-set, fore-token long life; and much more if some new *Teeth* put forth in our elder years.

A broad *Breast*, yet not bearing out, but rather bending inwards; *Shoulders* somewhat crooked, and (as they call such persons) round-back'd; a flat *Belly*; a *Hand* large, and with few lines in the Palm; a short and round *Foot*, *Thighs* not fleshy, and *Calves* of the *Leggs* not hanging over, but neat, are signs of long life.

Eyes somewhat large, and the *Circles* of them inclined to greenness; *Senses* not too quick; the *Pulse* in youth slower, towards old age quicker; *Facility* of holding the *breath*, and longer than usual; the body in youth inclined to be bound, in the decline of years more laxative, are also signs of long life.

Concerning the *Times* of *Nativity*, as they refer to long life, nothing hath been observed worthy the setting down, save onely *Astrological Observations*, which we rejected in our *opicks*. A *Birth* at the eighth month is not onely long-liv'd, but not likely to live. Also *inter births* are accounted the longer-liv'd.

A *Pythagorical* or *Monastical Diet*, according to strict rules, and always exactly equal, (as that of *Cornarus* was) seemeth to be very effectual for long life. Yet on the contrary, amongst those that live freely and after the common sort, such as have good *stomachs*, and feed more plentifully, are often the longest-liv'd. The *middle diet*, which we account the temperate, is commended, and conduceth to good health, but not to long life: for the *spare diet* begets few *Spirits*, and dull, and so wasteth the body less; and the *liberal diet* yieldeth more ample nourishment, and so repaireth more: but the *middle diet* doth neither of both, for where the Extreame are hurtful, there the Mean is best; but where the Extreame are helpful, there the Mean is nothing worth.

Now to that *spare diet* there are requisite *Watching*, lest the *Spirits* being few should be oppressed with much sleep; *little Exercise*, lest they should exhale; *abstinence* from *Venery*, lest they should be exhausted: but to the *liberal diet*, on the other side, are requisite much *Sleep*, frequent *Exercises*, and a seasonable use of *Venery*. *Baths* and *Anointings* (such as were anciently in use) did rather tend to deliciousness than to prolonging of life. But of all these things we shall speak more exactly when we come to the *Inquisition* according to *Intentions*. Mean while that of *Celsus*, who was not onely a learned Physician, but a wise man, is not to be omitted, who adviseth interchanging and alternation of the diet, but still with an inclination to the more benign: as that a man should sometimes accustom himself to

watching,

46.

watching, sometimes to sleep; but to sleep oftneft: again, that he should sometimes give himself to fasting, sometimes to feasting; but to feasting oftneft: that he should sometimes inure himself to great labours of the miud; sometimes to relaxations of the same; but to relaxations oftneft. Certainly this is without all question, that *Diet* well ordered bears the greatest part in the prolongation of life: neither did I ever meet an extream long liv'd man, but being asked of his course, he observed something peculiar; some one thing, some another. I remember an *old man*, above an hundred years of age, who was produced as witness touching an ancient Prescription. When he had finished his testimony the *Judge* familiarly asked him how he came to live so long. He answered, beside expectation, and not without the laughter of the hearers, *By eating before I was hungry, and drinking before I was dry.* But of these things we shall speak hereafter.

47.

A Life led in *Religion* and in *Holy Exercises* seemeth to conduce to long life. There are in this kind of life these things, Leisure, Admiration and Contemplation of heavenly things, Joyes not sensual, noble hopes; wholesome Fears, sweet Sorrows; lastly, continual Renovations by Observances, Penances, Expiations: all which are very powerful to the prolongation of life. Unto which if you add that austere diet which hardneth the ma's of the Body, and humbleth the Spirits, no marvel if an extraordinary length of life do follow; such was that of *Paul the Hermite*, *Simcon Sclita the Columnar Anchorite*, and of many other *Hermites* and *Anchorites*.

48.

Next unto this is the life led in good Letters, such as was that of Philosophers, Rhetoricians, Grammarians. This life is also led in leisure, and in those thoughts, which, seeing they are severed from the affairs of the world, bite not, but rather delight through their Variety and Impertinency: They live also at their pleasure, spending their time in such things as like them best, and for the most part in the company of young men, which is ever the most chearful. But in Philosophies there is great difference betwixt the Sects as touching long life: For those Philosophies which have in them a touch of Superstition, and are conversant in high Contemplations, are the best; as the *Pythagorical* and *Platonick*: also those which did institute a perambulation of the world, and considered the variety of natural things, and had reachless, and high, and magnanimous thoughts, (as of *Infinitem*, of the Stars, of the Heroical Vertues, and suchlike) were good for lengthning of life; such were those of *Democritus*, *Philolaus*, *Xenophanes*, the *Astrologians* and *Stoicks*: also those which had no profound Speculation in them, but discoursed calmly on both sides, out of common Sense, and the received Opinions, without any sharp Inquisitions, were likewise good; such were those of *Carneades* and the *Academicks*, also of the *Rhetoricians* and *Grammarians*. But contrary, Philosophies conversant in perplexing Subtilties, and which pronounced peremptorily, and which examined and wrested all things to the Scale of Principles, lastly, which were thorny and narrow, were evil: such were those commonly of the *Peripateticks*, and of the *School-men*.

49.

The *Country life* also is well fitted for long life: it is much abroad, and in the open air, it is not slothful, but ever in employment; it feedeth upon fresh Cates, and unbought; it is without Cares and Envy.

50.

For the *Military life*, we have a good opinion of that whilst a man is young. Certainly many excellent *Warriors* have been long-liv'd; *Corvinus*, *Camillus*, *Xenophon*, *Agessilaus*, with others both ancient and modern. No doubt it furthereth long life to have all things from our youth to our elder age mend, and grow to the better, that a Youth full of crosses may minister sweetness to our Old age. We conceive also that *Military affections*, inflamed with a desire of Fighting, and hope of Victory, do infuse such a heat into the *Spirits*, as may be profitable for long life.

Medicines for Long Life.

To the tenth Article.

The Art of Physick, which we now have, looks no farther commonly than to Conservation of Health and Cure of Diseases: As for those things which tend properly to Long Life, there is but slight mention, and by the way onely. Notwithstanding we will proponnd those Medicines which are notable in this kind, I mean, those which are Cordials. For it is consonant to reason, that those things which being taken in Cures do defend and fortifie the Heart, or, more truly, the Spirits, against Poysons and Diseases, being transferred with judgment and choice into Diet, should have a good effect, in some sort, towards the Prolonging of Life. This we will do, not heaping them promiscuously together, (as the manner is) but selecting the best.

Gold is given in three forms; either in that which they call *Aurum potable*, or in *Wine* wherein *Gold* hath been quenched, or in *Gold* in the Substance, such as are *Leaf-gold*, and the *Filings of Gold*. As for *Aurum potable*, it is used to be given in desperate or dangerous diseases, and that not without good success. But we suppose that the *Spirits of the Salt*, by which the *Gold* is dissolved, do rather minister that vertue which is found in it, than the *Gold* it self; though this secret be wholly suppressed. Now if the body of *Gold* could be opened with these *Corrosive waters*, or by these *Corrosive waters* (so the venomous quality were wanting) well washed, we conceive it would be no unprofitable Medicine.

Pearls are taken either in a fine Powder, or in a certain Mass, or Dissolution by the juice of four and new Limons; and they are given sometimes in Aromatical Confections, sometimes in Liquor. The *Pearl*, no doubt, hath some affinity with the Shell in which it groweth, and may be of the same quality with the Shells of *Cra-fishes*.

Amongst the transparent precious Stones, two onely are accounted Cordial, the *Emerauld* and the *Jacinth*, which are given under the same forms that the *Pearls* are; save only that the dissolutions of them, as far as we know, are not in use. But we suspect these *Glassie Jewels*, lest they should be cutting.

Of these which we have mentioned, how far and in what manner they are helpful, shall be spoken hereafter.

Bezoar-Stone is of approved vertue for refreshing the Spirits, and procuring a gentle Sweat. As for the *Unicorn's Horn*, it hath lost the credit with us; yet so, as it may keep rank with *Hart's Horn*, and the *Bone* in the heart of a *Hart*, and *Ivory*, and such like.

Amber-greece is one of the best to appease and comfort the Spirits.

Hereafter follow the names only of the *Simple Cordials*, seeing their Vertues are sufficiently known.

Hot.	Hot.	Cold.	Cold.
Saffron.	Clove-Gilly-flowers.	Nitre.	Juice of sweet
Folium Indum.	Oreng-flowers.	Roses. Violets.	Orenges.
Lignum Aloes.	Rosemary.	Strawberry-	Juice of Pearmains.
Citron Pill or	Mint.	Leaves.	Borage.
Rind.	Betony.	Straw-berries.	Bugloss.
Balm.	Carduus Benedi-	Juice of sweet	Burnet. Sanders.
Basil.	ctus.	Limons.	Camphire.

Seeing our speech now is of those things which may be transferred into Diet, all hot Waters and Chymical Oiles, (which, as a certain Trifler saith, are under the Planet Mars, and have a furious and destructive force) as also all hot and biting Spices are to be rejected, and a Consideration to be had, how waters and Liquors may be made of the former Simples: not those phlegmatick distilled waters, nor again those burning Waters of spirits of wine; but such as may be more temperate, and yet lively, and sending forth a benign Vapour.

I make some question touching the frequent letting of *Bloud*, whether it conduceth to long life nor no; and I am rather in the opinion that it doth, if it be turned into a habit, and other things be well disposed: for it letteth out the old Juice of the body, and bringeth in new.

I suppose also, that some *Emaciating Diseases* well cured, do profit to long life, for they yield new Juice, the old being consumed; and, as (as he saith) *To recover a sickness is to renew youth*: Therefore it were good to make some *Artificial Diseases*, which is done by strict and *Emaciating Diets*, of which I shall speak hereafter.

The Intentions.

To the 12,
13, and 14
Articles.

HAVING finished the Inquisition according to the Subjects, as namely, of Inanimate Bodies, Vegetables, Living Creatures, Man; I will now come nearer to the matter, and order mine Inquisitions by certain Intentions, such as are true and proper, (as I am wholly persuaded) and which are the very paths to Mortal Life. For in this part, nothing that is of worth hath hitherto been inquired, but the contemplations of men have been but simple, and non-proficients. For when I hear men on the one side speak of comforting Natural heat, and the Radical moisture; and of Meats which breed good Blood; such as may neither be burnt nor phlegmatick; and of the clearing and recreating the Spirits; I suppose them to be no bad men which speak these things: but none of these worketh effectually towards the end. But when on the other side I hear several discourses touching Medicines made of Gold, because Gold is not subject to corruption; and touching Precious Stones to refresh the spirits by their hidden properties and lustre, and that if they could be taken and retained in Vessels, the Balsoms, and Quintessences of living Creatures, would make men conceive a proud hope of Immortality: And that the Flesh of Serpents and Harts, by a certain consent, are powerful to the Renovation of Life, because the one casteth his skin, the other his Horns: (they should also have added the Flesh of Eagles, because the Eagle changes his Bill): And that a certain Man, when he had found an Oynment hidden under the ground, and had anointed himself therewith from head to foot, (excepting onely the soles of his feet) did, by his anointing, live three hundred years, without any disease, save onely some Tumors in the soles of his feet: and of Artelius, who when he found his Spirit ready to depart, drew into his body the spirit of a certain young man, and thereby made him breathless, but himself lived many years by another mans Spirit: And of Fortunate Hours according to the Figures of Heaven, in which Medicines are to be gathered and compounded for the prolongation of Life: And of the Seales of Planets, by which vertues may be drawn and fetched down from Heaven to prolong Life: and such like fabulous and superstitious vanities: I wonder exceedingly that men should so much doat, as to suffer themselves to be deluded with these things. And again, I do pity Mankind that they should have the hard fortune to be besieged with such frivolous and senseless apprehensions. But mine Intentions do both come home to the Matter, and are far from vain and credulous Imaginations; being also such, as I conceive, posterity may adde much to the matters which satisfy these Intentions; but to the Intentions themselves, but a little. Notwithstanding there are a few things, and those of very great moment, of which I would have men to be forewarned.

First, we are of that opinion, that we esteem the Offices of Life to be more worthy than Life it self. Therefore if there be any thing of that kind that may indeed exactly answer our Intentions, yet so, that the Offices and Duties of Life be thereby hindered; whatsoever it be of this kind, we reject it. Perhaps we may make some light mention of some things, but we insist not upon them. For we make no serious nor diligent discourse, either of leading the life in Caves, where the sunbeams and several changes of the Air pierce not, like Epimenides his Cave; or of perpetual Baths, made of Liquors prepared; or of Shirts, and Sear-cloths so applied, that the Body should be always as it were in a Box; or of thick paintings of the body, after the manner of some Barbarous Nations; or of an exact ordering of our Life and Diet, which aimeth onely at this, and mindeth nothing else but that a man live, (as was that of Herodotus amongst the Ancients, and of Cornarus the Venetian in our days, but with greater moderation;) or of any such Prodigy, Tediousness, or Inconvenience: but we propound such Remedies and Precepts, by which the Offices of Life may neither be deserted, nor receive any great interruptions or molestations.

Secondly,

Secondly, on the other side we denounce unto men that they will give over trifling, and not imagine that so great a work as the stopping and turning back the powerful course of nature, can be brought to pass by some Morning-draught, or the taking of some precious Drug, but that they would be assured that it must needs be, that this is a work of labour, and consisteth of many Remedies, and a fit connexion of them amongst themselves; for no man can be so stupid as to imagine, that what was never yet done, can be done, but by such ways as were never yet attempted.

Thirdly, we ingeniously profess, that some of those things which we shall propound have not been tried by us by way of Experiment, (for our course of life doth not permit that) but are derived (as we suppose) upon good reason, out of our Principles and Grounds, (of which some we set down, others we reserve in our mind) and are, as it were, cut and digged out of the Rock and Mine of Nature her self. Nevertheless we have been careful, and that with all providence and circumspection, (seeing the Scripture saith of the Body of Man, that it is more worth than Raiment) to propound such Remedies, as may at least be safe, if peradventure they be not fruitful.

Fourthly, we would have men rightly to observe and distinguish, that those things which are good for an Healthful Life, are not always good for a Long Life; for there are some things which do further the alacrity of the Spirits, and the strength and vigour of the Functions, which notwithstanding, do cut off from the sum of Life; and there are other things which are profitable to prolongation of Life, which are not without some peril of health, unless this matter be salved by fit Remedies; of which, notwithstanding, as occasion shall be offered, we will not omit to give some Cautions and Monitions.

Lastly we have thought good to propound sundry Remedies, according to the several Intentions; but the choice of those Remedies, and the order of them, to leave to Discretion: for to set down exactly which of them agreeth best, with which Constitution of Body, which with the several courses of Life, which with each Mans particular Age, and how they are to be taken one after another, and how the whole Practique of these things is to be administred and governed, would be too long, neither is it fit to be published.

In the Topicks we propounded three Intentions: The Prohibiting of Consumption, The Perfecting of Reparation, and the Renewing of Oldness. But seeing those things which shall be said are nothing less than words, we will deduce these three Intentions to ten Operations.

The first is, the Operation upon the Spirits that they may renew their vigour.

The second Operation is upon the Exclusion of Air.

The third Operation is upon the Bloud, and the Sanguifying Heat.

The fourth Operation is upon the Juices of the Body.

The fifth Operation is upon the Bowels, for their Extrusion of Aliment.

The sixth Operation is upon the Outward Parts, for their Attraction of Aliment.

The seventh Operation is upon the Aliment it self, for the Insinuation thereof.

The eighth Operation is upon the last Act of Assimilation.

The ninth Operation is upon the Inteneration of the Parts, after they begin to be dried.

The tenth Operation is upon the Purging away of Old Juice, and Supplying of New Juice.

Of these Operations, the four first belong to the First Intention, the four next to the Second Intention, and the two last to the Third Intention.

But because this part touching the Intentions doth tend to Practise, under the name of History, we will not onely comprise Experiments and Observations, but also Counsels, Remedies, Explications of Causes, Assumptions, and whatsoever hath reference hereunto.

The Operation upon the Spirits that they may remain Youthful, and renew their Vigour.

The History.

1. **T**HE *Spirits* are the Master-workmen of all effects in the *Body*. This is manifest by Consent, and by infinite instances.
2. If any man could procure that a young man's *Spirit* could be conveyed into an old man's *Body*, it is not unlikely but this great Wheel of the *Spirits* might turn about the lesser Wheel of the *Parts*, and so the course of Nature become retrograde.
3. In every Consumption, whether it be by Fire or by Age, the more the *Spirit* of the *Body*, or the Heat, preyeth upon the Moisture, the lesser is the duration of that thing. This occurs every where, and is manifest.
4. The *Spirits* are to be put into such a temperament and degree of activity, that they should not (as he saith) *drink* and *guzzle* the juices of the *Body*, but *sip* them *onely*.
5. There are two kinds of *Flames*: the one eager and weak, which consumes slight substances but hath little power over the harder; as the flame of straw, or small Sticks: the other strong and constant, which converts hard and obstinate substances; as the flame of hard wood, and such like.
6. The eager flames, and yet less robust, do dry *Bodies*, and render them exhaust and sapless; but the stronger flames do intenerate and melt them.
7. Also in *Dissipating Medicines*, some vapour forth the thin part of the tumors or swellings, and these harden the tumour; others potently discuss, and these soften it.
8. Also in *Purging* and *Absterging Medicines*, some carry away the fluid humors violently, others draw the more obstinate and viscous.
9. The *Spirits* ought to be invested and armed with such a heat, that they may chuse rather to stir and undermine hard and obstinate matters, than to discharge and carry away the thin and prepared; for by that means the *Body* becomes green and solid.
10. The *Spirits* are so to be wrought and tempered, that they may be in Substance Dense, not Rare; in Heat Strong, not Eager; in Quantity Sufficient for the offices of Life, not Redundant or Turgid; in Motion Appeased, not Dancing or Unequal.
11. That *Vapours* work powerfully upon the *Spirits*, it is manifest by Sleep, by Drunkenness, by Melancholick Passions, by letificant Medicines, by Odours, calling the *Spirits* back again in Swounings and Faintings.
12. The *Spirits* are condensed four ways; either by putting them to flight, or by refrigerating and cooling them, or by stroaking them, or by quieting them. And first of their Condensation by putting them to flight.
13. Whatsoever putteth to flight on all parts, driveth the body into his Centre, and so Condenseth.
14. To the Condensation of the *Spirits* by flight, the most powerful and effectual is *Opium*, and next *Opiates*, and generally all *Soporiferous things*.
15. The force of *Opium* to the condensation of the *Spirits* is exceeding strong, whenas perhaps three grains thereof will in a short time so coagulate the *Spirits*, that they return no more, but are extinguished, and become immoveable.
16. *Opium*, and the like, put not the *Spirits* to flight by their coldness, for they have parts manifestly hot; but, on the contrary, cool by their putting the *Spirits* to flight.
17. The Flight of the *Spirits* by *Opium* and *Opiate Medicines* is best seen by applying the same outwardly; for the *Spirits* straight with-draw themselves, and will return no more, but the part is mortified, and turns to a *Gangrene*.
18. *Opiates*, in grievous pains, as in the Stone, or the cutting off of a Limb, mitigate pains most of all, by putting the *Spirits* to flight.
19. *Opiates* obtain a good effect from a bad cause; for the Flight of the *Spirits* is evil, but the Condensation of them through their flight is good.

The *Grecians* attributed much, both for health and for prolongation of life, as *Opiates*: but the *Arabians* much more, insomuch that their *grand Medicines* (which they called the *gods Hands*) had *Opium* for their Basis and principal Ingredient, other things being mixed to abate and correct the noxious qualities thereof; such were *Treacle*, *Methridate*, and the rest.

20.

Whatsoever is given with good success in the curing of *Pestilential* and *Malignant Diseases*, to stop and bridle the *Spirits*, lest they grow turbulent and tumultuate, may very happily be transferred to the prolongation of life; for one thing is effectual unto both, namely, the *condensation* of the *Spirits*: now there is nothing better for that than *Opiates*.

21.

The *Turks* find *Opium*, even in a reasonable good quantity, harmless and comfortable, insomuch that they take it before their Battel to excite courage: but to us, unless it be in a very small quantity, and with good Correctives, it is mortal.

22.

Opium and *Opiates* are manifestly found to excite *Venus*; which shews them to have force to corroborate the *Spirits*.

23.

Distilled water of wilde Poppy is given with good success in Surfeits, Agues, and divers diseases; which no doubt is a temperate kind of *Opiate*. Neither let any man wonder at the various use of it; for that is familiar to *Opiates*, in regard that the *Spirits*, corroborated and condensed, will rise up against any disease.

24.

The *Turks* use a kind of Herb which they call *Caphe*, which they dry and powder, and then drink in warm water; which, they say, doth not a little sharpen them, both in their Courage, and in their *Wits*; notwithstanding, if it be taken in a large quantity, it affects and disturbs the mind: whereby it is manifest, that it is of the same nature with *Opiates*.

25.

There is a Root much renowned in all the *Eastern parts*, which they call *Betel*, which the *Indians* and others use to carry in their mouths, and to champ it, and by that champing they are wonderfully enabled both to endure labours, and to overcome sicknesses, and to the act of carnal copulation: It seems to be a kind of *Stupefactive*, because it exceedingly blacks the Teeth.

26.

Tobacco in our age is immoderately grown into use, and it affects men with a secret kind of delight, insomuch that they who have once inured themselves unto it can hardly afterwards leave it: and no doubt it hath power to lighten the body, and to shake off weariness. Now the vertue of it is commonly thought to be, because it opens the passages, and voids humors: but it may more rightly be referred to the *condensation* of the *Spirits*; for it is a kind of *Henbane*, and manifestly troubles the Head, as *Opiates* do.

27.

There are sometimes *Humors* engendred in the body, which are, as it were, *Opiate* themselves; as it is in some kind of *Melancholies*, with which if a man be affected, it is a sign of very long life.

28.

The *simple Opiates* (which are also called *stupefactive*) are these: *Opium* it self, which is the juice of *Poppy*; both the *Poppies*, as well in the Herb as in the Seed; *Henbane*, *Mandrake*, *Hemlock*, *Tobacco*, *Night-shade*.

29.

The *compound Opiates* are, *Treacle*, *Methridate*, *Trisera*, *Ladanum*, *Paracelsi*, *Diaconium*, *Diascordium*, *Philonium*, *Pills of Hounds-tongue*.

30.

From this which hath been said, certain Designations or Counsels may be deduced for the prolongation of life, according to the present intension; namely, of *condensing* the *Spirits* by *Opiates*.

31.

Let there be therefore every year, from Adult years of Youth, an *Opiate* diet; let it be taken about the end of *May*, because the *Spirits* in the Summer are more loose and attenuated, and there are less dangers from cold humours; let it be some *Magistral Opiate*, weaker than those that are commonly in use, both in respect of a smaller quantity of *Opium*, and of a more sparing mixture of extreme hot things; let it be taken in the morning betwixt sleeps. The fare for that time would be more simple and sparing than ordinary, without Wine, or Spices, or Vapourous things. This Medicine to be taken onely each other day, and to be continued for a fortnight. This Designation in our judgment comes home to the intension.

32.

Opiates also may be taken, not onely by the mouth, but also by *Fumes*; but the *Fumes* must be such as may not move the expulsive Faculty too strongly, nor force down humours, but onely taken in a *West*, may work upon the *Spirits* within the brain. And therefore a *Suffumigation* of *Tobacco*, *Lignum-Aloes*, *Rosemary-leaves* dried,

33.

dried, and a little *Myrrhe* snuffed up in the morning at the mouth and nostrils, would be very good.

34. In *Grand Opiates*, such as are *Treacle*, *Methridate*, and the rest, it would not be amiss (especially in youth) to take rather the *distilled Waters* of them than themselves in their bodies; for the vapour in distilling doth rise, but the heat of the Medicine commonly fetleth. Now *distilled waters* are good in those vertues which are conveyed by Vapours, in other things but weak.

35. There are Medicines which have a certain weak and hidden degree, and therefore safe to an *Opiate* vertue; these send forth a slow and copious vapour, but not malignant as *Opiates* do, therefore they put not the Spirits to flight; notwithstanding they congregate them, and somewhat thicken them.

36. Medicines in order to *Opiates* are principally *Saffron*, next *Folium Indum*, *Amber-greese*, *Coriander-seed prepared*, *Amomum*, *Pseuda-momum*, *Lignum-Rhodum*, *Orange-flower water*, and much more the *Infusion* of the same *Flowers* new gathered in the Oil of *Almonds*; *Nutmegs* pricked full of holes, and macerated in *Rose-water*.

37. As *Opiates* are to be taken very sparingly, and at certain times, as was said, so these secondaries may be taken familiarly, and in our daily diet, and they will be very effectual to prolongation of life. Certainly an *Apothecary* of *Calecute*, by the use of *Amber*, is said to have lived an hundred and sixty years; and the *Noble-men* of *Barbary*, through the use thereof, are certifi'd to be very long-liv'd, whereas the mean people are but of short life. And our *Ancestors*, who were longer-liv'd than we, did use *saffron* much in their *Cakes*, *Broths*, and the like. And touching the first way of condensing the Spirits of *Opiates* and the *Subordinates* thereto, thus much.

38. Now we will enquire of the second way of condensing the *spirits* by *Cold*. For the proper work of *Cold* is *Condensation*, and it is done without any malignity, or adverse quality; and therefore it is a safer operation than by *Opiates*, though somewhat less powerful, if it be done by turns onely, as *Opiates* are. But then again, because it may be used familiarly, and in our daily diet with moderation, it is much more powerful for the prolongation of life than by *Opiates*.

39. The *Refrigeration* of the Spirits is effected three ways, either by *Respiration*, or by *Vapours*, or by *Aliment*. The first is the best, but, in a sort, out of our power; the second is potent, but yet ready, and at hand; the third is weak, and somewhat about.

40. *Air clear* and *pure*, and which hath no fogginess in it, before it be received into the Lungs, and which is least exposed to the Sun-beams, condenseth the Spirits best. Such is found either on the tops of dry Mountains, or in *Champagnes* open to the wind, and yet not without some shade.

41. As for the *Refrigeration* and *Condensation* of the *Spirits* by *Vapours*, the Root of this operation we place in *Nitre*, as a Creature purposely made and chosen for this end, being thereunto led, and perswaded by these Arguments.

42. *Nitre* is a kind of cool Spice: this is apparent to the sense it self, for it bites the Tongue and Palate with *cold*, as Spices do with *heat*, and it is the onely thing, as far as we know, that hath this property.

43. Almost all *cold things* (which are cold properly, and not by accident, as *Opium* is) are poor and jejune of Spirit; contrarily, things full of *Spirit* are almost all hot, onely *Nitre* is found amongst Vegetables, which aboundeth with *Spirit*, and yet is cold. As for *Camphire*, which is full of Spirit, and yet performeth the actions of cold, it cooleth by accident onely; as namely, for that by the thinness thereof, without *Aerimony*, it helpeth perspiration in inflammations.

44. In *congealing* and *freezing* of *Liquors*, (which is lately grown into use) by laying *Snow* and *Ice* on the out-side of the Vessel, *Nitre* is also added, and no doubt it exciteth and fortifieth the *Congelation*. It is true, that they use also for this work ordinary *Bay-Salt*, which doth rather give activity to the coldness of the *Snow*, than cool by it self: But, as I have heard, in the hotter Regions, where *Snow* falls not, the congealing is wrought by *Nitre* alone; but this I cannot certainly affirm.

45. It is affirmed that *Gun powder*, which consisteth principally of *Nitre*, being taken in drink, doth conduce to valour, and that it is used oftentimes by *Mariners* and *Souldiers* before they begin their *Battels*, as the *Turks* do *Opium*.

Nitre is given with good success in burning Agues, and Pestilential Fevers, to mitigate and bridle their pernicious heats. 46.

It is manifest, that *Nitre* in Gun-powder doth mightily abhor the Flame, from whence is caused that horrible Crack and puffing. 47.

Nitre is found to be, as it were, the *Spirit* of the Earth: for this is most certain, that any Earth, though pure and unmixed with Nitrous matter, if it be so laid up and covered, that it be free from the Sun-beams, and putteth forth no Vegetable, will gather *Nitre*, even in good abundance. By which it is clear, that the Spirit of *Nitre* is not onely inferiour to the *spirit* of living Creatures, but also to the *Spirit* of Vegetables. 48.

Cattle which drink of *Nitrous* water do manifestly grow fat, which is a sign of the cold in *Nitre*. 49.

The manuring of the Soil is chiefly by *Nitrous substances*; for all Dung is *Nitrous*, and this is a sign of the Spirit in *Nitre*. 50.

From hence it appears, that the Spirits of Man may be cooled and condensed by the Spirit of *Nitre*, and be made more crude, and less eager. And therefore, as strong Wines, and Spices, and the like, do burn the Spirits, and shorten life; so on the contrary side, *Nitre* doth compose and repress them, and furthereth to life. 51.

Nitre may be used with meat, mixed with our Salt, to the tenth part of the Salt; in Broths taken in the morning, for three grains to ten, also in Beer: but howsoever it be used, with moderation, it is of prime force to long life. 52.

As *Opium* holds the preheminance in *condensing* the Spirits, by putting them to *stight*, and hath withal his *Subordinates*, less potent, but more safe, which may be taken both in greater quantity, and in more frequent use; of which we have formerly spoken: so also *Nitre*, which condenseth the spirits by cold, and by a kind of *Frescour*, (as we now a-days speak) hath also his *Subordinates*. 53.

Subordinates to *Nitre* are, all those things which yield an Odour somewhat Earthy, like the smell of Earth, pure and good, newly digged or turned up; of this sort the chief are, *Borage*, *Bugloss*, *Langue de Bœuf*, *Burnet*, *Strawberry leaves* and *Strawberries*, *Frambois* or *Raspis*, raw *Cucumers*, raw *Pearmains*, *Vine-leaves*, and *Buds*; also *Violets*. 54.

The next in order are those which have a certain freshness of smell, but somewhat more inclined to heat; yet not altogether void of that vertue of refreshing by coolness; such as are *Balm*, *green Citrons*, *green Oranges*, *Rose-water distilled*, *roasted Wardens*; also the *Damask*, *Red*, and *Musk Roses*. 55.

This is to be noted, that *Subordinates* to *Nitre* do commonly confer more to this *Intension*, *Raw*, then having passed the Fire, because that the Spirit of Cooling is dissipated by the Fire; therefore they are best taken, either infused in some liquor, or raw. 56.

As the condensation of the Spirits by *Subordinates* to *Opium* is, in some sort, performed by *Odours*, so also that which is by *Subordinates* to *Nitre*; therefore the smell of new and pure Earth, taken either by following the Plough, or by digging, or by weeding, excellently refresheth the Spirits. Also the Leaves of Trees in Woods, or Hedges, falling towards the middle of Autumn, yield a good refreshing to the Spirits, but none so good as *Strawberry-leaves* dying. Likewise the smell of *Violets*, or *Wall-flowers*, or *Bean-flowers*, or *Sweet-briar*, or *Hony-suckles*, taken as they grow, in passing by them onely, is of the same nature. 57.

Nay, and we know a certain great Lord who lived long, that had every morning immediately after sleep, a Clod of fresh Earth laid in a fair Napkin under his Nose, that he might take the smell thereof. 58.

There is no doubt, but the cooling and tempering of the blood by cool things, such as are *Endive*, *Succory*, *Liver wort*, *Purslain*, and the like, do also by consequent cool the Spirits; but this is about, whereas vapours cool immediately. 59.

And as touching the condensing of the Spirits by Cold, thus much: The third way of condensing the Spirits, we said to be by that which we call *stroaking* the Spirits: The fourth, by *quieting* the *alacrity* and *unruliness* of them. 60.

Such things *stroke* the Spirits as are pleasing and friendly to them, yet they allure them not to go abroad; but rather prevail, that the Spirits contented, as it were, 61.

in their own society, do enjoy themselves, and betake themselves into their proper Centre.

61. For these, if you recollect those things which were formerly set down, as *Subordinates* to *Opium* and *Nitre*, there will need no other *Inquisition*.
62. As for the quieting of the *unruliness* of the Spirits, we shall presently speak of that, when we enquire touching their *Motion*. Now then, seeing we have spoken of that *Condensation* of the *Spirits* which pertaineth to their substance, we will come to the *temper* of *Heat* in them.
63. The *Heat* of the *spirits*, as we said, ought to be of that kind that it may be *robust*, not *eager*, and may delight rather to master the tough and obstinate, than to carry away the thin and light humors.
64. We must beware of *Spices*, *wine*, and strong *Drinks*, that our use of them be very temperate, and sometimes discontinued; also of *savory*, *wild marjoram*, *Penny-royal*, and all such as bite and heat the tongue; for they yield unto the *Spirits* an *heat* not *operative*, but *Predatory*.
65. These yield a *robust heat*, especially *Elecampane*, *Garlick*, *Carduus Benedictus*, *Water-cresses* while they are young, *Germander*, *Angelica*, *Zedoary*, *Vervain*, *Valerian*, *Myrrhe*, *Pepper-wort*, *Elder flowers*, *Garden-Chervile*: The use of these things with choice and judgement, sometimes in *Sallads*, sometimes in *Medicines*, will satisfie this *Operation*.
66. It falls out well that the *Grand Opiales* will also serve excellently for this *Operation*, in respect that they yield such an *heat* by composition, which is wished, but not to be found, in *Simples*. For the mixing of those excessive hot things (such as are *Euphorbium*, *Pellitory of Spain*, *stavis-acre*, *Dragon-wort*, *Anacardi*, *castoreum*, *Aristolochium*, *Opponax*, *Ammoniacum*, *Galbanum*, and the like, which of themselves cannot be taken inwardly) to qualifie and abate the *stupefactive* virtue of the *Opium*, they do make such a constitution of a *Medicament* as we now require; which is excellently seen in this. That *Treacle* and *Methridate*, and the rest, are not sharp, nor bite the tongue, but are onely somewhat bitter, and of strong scent, and at last manifest their heat when they come into the stomach, and in their subsequent operations.
67. There conduce also to the *robust heat* of the *Spirits* *Venus* often excited, rarely performed; and no less some of the affections, of which shall be spoken hereafter. So touching the heat of the *Spirits*, Analogical to the prolongation of *Life*, thus much.
68. Touching the *Quantity* of the *Spirits*, that they be not *exuberant* and *boiling*, but rather *sparing*, and within a mean, (seeing a small flame doth not devour so much as a great flame) the *Inquisition* will be short.
69. It seems to be approved by experience, that a *spare Diet*, and almost a *Pythagorical*, such as is either prescribed by the strict Rules of a *Monastical life*, or practised by *Hermites*, which have *Necessity* and *Poverty* for their Rule, rendreth a man long-liv'd.
70. Hitherto appertain *drinking of water*, a *hard Bed*, *abstinence from Fire*, a *slender Diet*, (as namely, of *Herbs*, *Fruits*, *Flesh*, and *Fish*, rather *powdered* and *salted* than *fresh* and *hot*) an *Hair-shirt*, *frequent Fastings*, *frequent Watchings*, *few sensual Pleasures*, and such like; for all these diminish the *Spirits*, and reduce them to such a *quantity* as may be sufficient onely for the *Functions of Life*, whereby the *degradation* is the less.
71. But if the *Diet* shall not be altogether so *rigorous* and *mortifying*, yet notwithstanding shall be always *equal* and *constant* to it self, it worketh the same effect. We see it in *Flames*, that a *Flame* somewhat bigger (so it be always alike and quiet) consumeth less of the fuel than a lesser *Flame* blown with *Bellows*, and by *Custs* stronger or weaker: That which the *Regiment* and *Diet* of *Cornarus* the *Venetian* shewed plainly, who did eat and drink so many years together by a just weight, whereby he exceeded an hundred years of age, strong in limbs, and intire in his senses.
72. Care also must be taken, that a body plentifully nourished, and not emaciated by any of these aforesaid Diets, omitteth not a seasonable use of *Venus*, lest the *Spirits* increase too fast, and soften and destroy the body. So then, touching a moderate *quantity* of *Spirits*, and (as we may say) *Frugal*, thus much.
73. The *Inquisition* touching *bridling* the *motions* of the *Spirits* followeth next.

Motion doth manifestly attenuate and inflame them. This bridling is done by three means: by *Sleep*; by *avoiding of vehement Labours, immoderate Exercise*, and, in a word, all *Lassitude*; and by refraining in *some Affections*. And first, touching *Sleep*.

The Fable tells us, that *Epimenides* slept many years together in a Cave, and all that time needed no meat, because the *Spirits* waste not much in *sleep*. 74.

Experience teacheth us that certain Creatures, as *Dormice* and *Bats*, sleep in some close places an whole Winter together; such is the force of *sleep* to restrain all vital Consumption. That which *Bees* and *Drones* are also thought to do, though sometimes destitute of *Honey*; and likewise *Butter-flies*, and other *Flaes*. 75.

Sleep after *Dinner* (the stomach sending up no unpleasing Vapours to the head; as being the first Dews of our Meat) is good for the *spirits*, but derogatory and hurtful to all other points of health. Notwithstanding in extreame old age there is the same reason of Meat and *Sleep*, for both our meals and our *sleeps* should be then frequent, but short and little; nay, and towards the last period of old age, a mere *Rest*, and, as it were, a perpetual *Reposing* doth best, especially in Winter-time. 76.

But as moderate *sleep* conferreth to long life, so much more if it be *quiet* and not *disturbed*. 77.

These procure *quiet sleep*, *Violets*, *Lettuce*, especially boiled; *Sarrup* of dried *Roses*, *Saffron*, *Balm*, *Apples*, at our going to bed; a *sop* of *Bread* in *Malmsey*, especially where *Musk-Roses* have been first *infused*: therefore it would not be amiss to make some *Pill*, or a small Draught of these things, and to use it familiarly. Also those things which shut the mouth of the stomach close, as *Coriander-seed* prepared, *Quinces* and *Wardens* roasted, do induce sound *sleep*; but above all things in youth, and for those that have sufficient strong stomachs, it will be best to take a good draught of *clear cold Water* when they go to bed. 78.

Touching voluntary and procured Trances, as also fixed and profound Thoughts, so as they be without *irksomness*; I have nothing certain: no doubt they make to this Intention, and condense the *Spirits*, and that more potently than *Sleep*, seeing they lay asleep, and suspend the senses as much or more. Touching them, let further inquiry be made. So far touching *Sleep*.

As for *Motion* and *Exercise*, *Lassitude* hurteth, and so doth all *Motion* and *Exercise* which is too nimble and swift; as *Running*, *Tennis*, *Fencing*, and the like; and again, when our strength is extended and strained to the uttermost, as *Dancing*, *Wrestling*, and such like: for it is certain, that the *spirits* being driven into streights, either by the swiftness of the motion, or by the straining of the forces, do afterward become more eager and predatory. On the other side, *Exercises* which stir up a good strong motion, but not over-swift, or to our utmost strength, (such as are *Leaping*, *Shooting*, *Riding*, *Bowling*, and the like) do not hurt, but rather benefit. 79.

We must come now to the *Affections* and *Passions* of the *Mind*, and see which of them are hurtful to long life, which profitable.

Great Joys attenuate and diffuse the *spirits*, and shorten life; *familiar Chearfulness* strengthens the *spirits*, by calling them forth, and yet not resolving them. 80.

Impressions of *Joy* in the sense are naught; *ruminations* of *Joy* in the memory, or apprehensions of them in hope or fancy, are good. 81.

Joy suppressed, or communicated sparingly, doth more comfort the *spirits* than *Joy* poured forth and published. 82.

Grief and *sadness*, if it be void of *Fear*, and afflict not too much, doth rather prolong life; for it contracteth the *spirits*, and is a kind of *condensation*. 83.

Great Fears shorten the life: for though *Grief* and *Fear* do both streighten the *spirit*, yet in *Grief* there is a simple contraction; but in *Fear*, by reason of the cares taken for the remedy, and hopes intermixed, there is a turmoil and vexing of the *spirits*. 84.

Anger suppressed is also a kind of vexation, and causeth the *spirit* to feed upon the juices of the body; but let loose and breaking forth, it helpeth: as those *Medicines* do which induce a *robust heat*. 85.

Envy is the worst of all *Passions*, and feedeth upon the *spirits*, and they again upon the *body*; and so much the more because it is perpetual, and, as it is said, *keepeth no holidays*. 86.

Pity of another man's misfortune, which is not likely to befall our selves, is good. 87.

but *Pity*, which may reflect with some similitude upon the party pitying, is naught, because it exciteth *Fear*.

88. *Light shame* hurteth not, seeing it contracteth the *Spirits* a little, and then straight diffuleth them: infomuch that *shamefac'd* persons commonly live long: but *Shame* for some great ignominy, and which afflicteth the mind long, contracteth the *Spirits* even to suffocation, and is pernicious.

89. *Love*, if it be not unfortunate, and too deeply wounding, is a kind of *Joy*, and is subject to the same *Laws* which we have set down touching *Joy*.

90. *Hope* is the most beneficial of all the *Affections*, and doth much to the prolongation of life, if it be not too often frustrated, but entertaineth the *Fancy* with an expectation of good: therefore they which fix and propound to themselves some end, as the mark and scope of their life, and continually and by degrees go forward in the same, are, for the most part, long-liv'd; in so much that when they are come to the top of their hope, and can go no higher therein, they commonly droop, and live not long after: So that *Hope* is a *Leaf-joy*, which may be beaten out to a great extension, like *Gold*.

91. *Admiration* and *light contemplation* are very powerful to the prolonging of life; for they hold the *Spirits* in such things as delight them, and suffer them not to tumultuare, or to carry themselves unquietly and waywardly. And therefore all the *Contemplators* of *Natural things*, which had so many and eminent Objects to admire, (as *Democritus*, *Plato*, *Parmedides*, *Apollonius*.) were long liv'd: also *Rhetoricians*, which tasted but lightly of things, and studied rather Exornation of speech than profundity of matters, were also long-liv'd; as *Gorgias*, *Protagoras*, *Socrates*, *Seneca*. And certainly, as old men are for the most part talkative, so talkative men do often grow very old; for it shews a *light contemplation*, and such as doth not much stain the *Spirits*, or vex them: but subtil, and acute, and eager inquisition shortens life; for it tireth the *Spirit*, and wasteth it.

And as touching the *motion* of the *Spirits* by the *Affections* of the *Mind*, thus much. Now we will adde certain other general *Observations* touching the *Spirits*, beside the former, which fall not into the precedent distribution.

92. Especial care must be taken that the *Spirits* be not too often *resolved*; for attenuation goeth before resolution, and the *Spirit* once attenuated doth not very easily retire, or is *condensed*. Now *Resolution* is caused by over-great labours, over-vehement affections of the mind, over great sweats, over great evacuations, hot Baths, and an untemperate and unseasonable use of *Venus*; also by over-great cares and carpings, and anxious expectations; lastly, by malignant diseases, and intolerable pains and torments of the body: all which, as much as may be, (which our vulgar *Physicians* also advise) must be avoided.

93. The *Spirits* are delighted both with *wonted* things, and with *new*. Now it maketh wonderfully to the conservation of the *Spirits* in vigour, that we neither use *wonted* things to a satiety and glutting; nor *new* things, before a quick and strong appetite. And therefore both *customs* are to be broken off with judgment and care, before they breed a fullness; and the *appetite* after new things to be restrained for a time until it grow more sharp and jocond: and moreover, the *life*, as much as may be, so to be ordered, that it may have many *renovations*, and the *Spirits* by perpetual conversing in the same actions may not wax dull. For though it were no ill saying of *Seneca's*, *The fool doth ever-begin to live*; yet this folly, and many more such, are good for long life.

94. It is to be observed touching the *Spirits*, (though the contrary used to be done) That when men perceive their *Spirits* to be in good, placid, and healthful state, (that which will be seen by the tranquility of their *Mind*, and chearful disposition) that they cherish them, and not change them: but when, in a turbulent and untoward state, (which will also appear by their sadness, lumpishness, and other indisposition of their mind) that then they straight overwhelm them, and alter them. Now the *Spirits* are contained in the same state, by a restraining of the affections, temperateness of diet, abstinence from *Venus*, moderation in labour, indifferent rest and repose: and the contrary to these do alter and overwhelm the *Spirits*; as namely, vehement affections, profuse feasting, immoderate *Venus*, difficult labours, earnest studies, and prosecution of business. Yet men are wont, when they are merriest and best disposed, then to apply themselves to feasting,

Venus, Labours, Endeavours, Busineses, whereas if they have a regard to long life, (which may seem strange) they should rather practise the contrary. For we ought to cherish and preserve good *Spirits*, and for the evil-disposed *Spirits* to discharge and alter them.

Ficinus saith not unwisely, That *old men*, for the comforting of their spirits, ought often to remember and ruminare upon the *Acts* of their *Childhood* and *Youth*. Certainly such a remembrance is a kind of peculiar Recreation to every *old man*: and therefore it is a delight to men to enjoy the society of them which have been brought up together with them, and to visit the places of their education. *Vespasian* did attribute so much to this matter, that when he was *Emperour* he would by no means be perswaded to leave his Father's house, though but mean, lest he should lose the wonted object of his eyes, and the memory of his childhood; and besides, he would drink in a *wooden Cup*, tipped with silver; which was his *Grandmother's*; upon *Festival dayes*.

95.

One thing above all is grateful to the *Spirits*, that there be a *continual progress* to the more *benign*; therefore we should lead such a *Youth* and *manhood*, that our *Old age* should find new *Solaces*, whereof the chief is *moderate ease*: And therefore *old men* in honourable places lay violent hands upon themselves, who retire not to their ease: whereof may be found an eminent Example in *Cassiodorus*, who was of that reputation amongst the *Gothish Kings* of *Italy*, that he was as the *Soul* of their affairs; afterwards, being near eighty years of age, he betook himself to a *Monastery*; where he ended not his dayes before he was an hundred years old. But this thing doth require two *Cautions*: one, that they drive not off till their bodies be utterly worn out and diseased: for in such bodies all mutation, though to the more *benign*; hasteneth death: the other, that they surrender not themselves to a *sluggish ease*, but that they embrace something which may entertain their thoughts and mind with contentation; in which kind the chief delights are *Reading* and *Contemplation*; and then the desires of *Building* and *Planting*.

96.

Lastly, the same *Action*, *Endeavour* and *Labour* undertaken *cheerfully* and with a *good will* doth refresh the *Spirits*; but with an *aversion* and *unwillingness*, doth fret and deject them. And therefore it conferreth to long life, either that a man hath the art to institute his life so as it may be free and suitable to his own humour; or else to lay such a command upon his mind, that whatsoever is imposed by *Fortune*, it may rather lead him than drag him,

97.

Neither is that to be omitted towards the government of the *Affections*, that especial care be taken of the *mouth* of the *Stomach*, especially that it be not too much relaxed; for that part hath a greater dominion over the *affections*, especially the daily *affections*, than either the *Heart* or *Brain*; onely those things excepted which are wrought by potent vapours, as in *Drunkenness* and *Melancholly*.

98.

Touching the *Operation* upon the *Spirits*, that they may remain *youthful*, and *renew* their *vigour*, thus much: which we have done the more accurately, for that there is, for the most part, amongst *Physicians* and other *Authors* touching these *Operations* a deep silence; but especially, because the *Operation* upon the *Spirits*, and the *maxing green again*, is the most ready and compendious way to long life; and that for a two-fold compendiousness: one, because the *Spirits* work compendiously upon the body; the other, because *Vapours* and the *Affections* work compendiously upon the *Spirits*; so as these attain the end, as it were, in a right line, other things rather in lines circular.

99.

The Operation upon the Exclusion of the Air. 2.

The History.

THE *Exclusion* of the *Air ambient* tendeth to length of life two wayes: First for that the *External Air*, next unto the *Native Spirit*, (howsoever the *Air* may be said to animate the *Spirit of Man*, and conferreth not a little to health) doth most of all prey upon the juices of the body,

1.

and hasten the Desiccation thereof; and therefore the *Exclusion* of it is effectual to length of life.

2. Another effect which followeth the *Exclusion* of *Air* is much more subtil and profound, namely, that the Body clos'd up, and not perspiring by the pores, detaineth the *Spirits* within, and turneth it upon the harder parts of the body, whereby the *Spirit* mollifies and intenerates them.

3. Of this thing the reason is explained in the *Desiccation* of *Inanimate Bodies*; and it is an Axiom almost infallible, That the *Spirit* discharged and issuing forth, drieth Bodies; detained, melteth and intenerateth them. And it is further to be assumed, That all Heat doth properly attenuate and moisten, and contracteth and drieth onely by Accident.

4. *Leading* the *Life* in *Dens* and *caves*, where the *Air* receives not the Sun-beams, may be effectual to long life. For the *Air* of it self doth not much towards the depredation of the body, unless it be stirred up by heat. Certainly, if a man shall recal things past to his memory, it will appear that the statures of men have been anciently much greater than those that succeeded, as in *Sicily*, and some other places: but this kind of men led their lives, for the most part, in *Caves*. Now length of life and largeness of limbs have some affinity. The *cave* also of *Epimenides* walks among the *Fables*. I suppose likewise, that the life of *Columnar Anchorites* was a thing resembling the life in *Caves*, in respect the Sun-beams could not much pierce thither, nor the *Air* receive any great changes or inequalities. This is certain, both the *Simeon Stelita's*, as well *Daniel* as *Saba*, and other *Columnar Anchorites*, have been exceeding long-liv'd. Likewise the *Anchorites* in our dayes, clos'd up and immured either within *Walls* or *Pillars*, are often found to be long-liv'd.

5. Next unto the life in *Caves* is the life on *Mountains*: for as the beams of the Sun do not penetrate into *Caves*; so on the tops of *Mountains*, being destitute of Reflexion, they are of small force. But this is to be understood of *Mountains* where the *Air* is clear and pure; namely, whether by reason of the driness of the *Vallies*, *Clouds* and *Vapours* do not ascend; as it is in the *Mountains* which encompass *Barbary*, where, even at this day, they live many times to an hundred and fifty years, as hath been noted before.

6. And this kind of *Air* of *Caves* and *Mountains*, of its own proper nature, is little or nothing predatory; but *Air*, such as ours is, which is predatory through the heat of the Sun, ought, as much as is possible, to be excluded from the body.

7. But the *Air* is prohibited and excluded two ways: first, by *closing* the *Pores*; secondly, by *filling* them up.

8. To the *closing* of the *Pores* help coldness of the air, going naked, whereby the skin is made hard, washing in cold water, *Astringents* applied to the skin, such as are *Mastick*, *Myrrhe*, *Myrtle*.

9. But much more may we satisfy this *Operation* by *Baths*, yet those rarely used, (especially in *Summer*) which are made of *Astringent Mineral waters*, such as may safely be used, as *Waters* participating of *Steel* and *Coperas*; for these do potently contract the skin.

10. As for *filling* up the *Pores*, *Paintings* and such like *Unctuous daubings*, and (which may most commodiously be used) *Oil* and *fat things*, do no less conserve the substance of the body, than *Oil-colours* and *Varnish* do preserve *Wood*.

11. The ancient *Britains* painted their bodies with *wood*, and were exceeding long liv'd: the *Picts* also used paintings, and are thought by some to have derived their name from thence.

12. The *Brasilians* and *Virginians* paint themselves at this day, who are (especially the former) very long liv'd; insomuch that five years ago the *French Jesuites* had speech with some who remembred the building of *Fernambuck*, which was done an hundred and twenty years since; and they were then at *Man's* estate.

13. *Joannes de temporibus*, who is reported to have extended his life to three hundred years, being asked how he preserved himself so long, is said to have answered, *By Oyl without, and by Honey within*.

14. The *Irish*, especially the *wild-Irish*, even at this day live very long: certainly they report, that within these few years the *countess* of *Desmond* lived to an hundred and forty years of age, and bred *Teeth* three times. Now the *Irish* have a fashion to chafe, and, as it were, to baste themselves with old *Salt-butter* against the fire.

The same *Irish* use to wear *Saffroned Linen* and *Shirts* : which though it were at first devised to prevent Vermin, yet howsoever I take it to be very useful for lengthning of life ; for *saffron*, of all things that I know, is the best thing for the skin, and the comforting of the flesh, seeing it is both notably *Astringent*, and hath besides an *Oleosity* and subtle heat, without any *Acrimony*. I remember a certain *Englishman*, who when he went to Sea carried a bagg of *Saffron* next his stomach, that he might conceal it, and so escape Custom ; and whereas he was wont to be always exceeding Sea-sick, at that time he continued very well, and felt no provocation to vomit.

Hippocrates adviseth in Winter to wear clean Linen, and in Summer foul Linen and besmeared with Oil. The reason may seem to be, because in Summer the *Spirits* exhale most, therefore the pores of the skin would be filled up.

Hereupon we are of opinion, that the use of *Oil*, either of *Olives* or sweet *Almonds*, to anoint the skin therewith, would principally conduce to long life : The anointing would be done every morning when we rise out of bed, with Oil in which a little *Bay-salt* and *Saffron* is mixed. But this anointing must be lightly done with Wool, or some soft sponge, not laying it on thick, but gently touching and wetting the skin.

It is certain that *Liquors*, even the *Oily* themselves, in great quantities draw somewhat from the body ; but contrarily, in small quantities are drunk in by the body : therefore the anointing would be but light, as we said, or rather the shirt it self would be besmeared with Oil.

It may happily be objected, that this anointing with Oil, which we commend, (though it were never in use with us, and amongst the *Italians* is cast off again) was anciently very familiar amongst the *Grecians* and *Romans*, and a part of their Diet ; and yet men were not longer-liv'd in those dayes than now. But it may rightly be answered, Oil was in use onely after Baths, unless it were perhaps amongst *Champions* : now hot Baths are as much contrary to our operation, as *Anointings* are congruous, seeing the one opens the passages, the other stops them up : therefore the Bath, without the anointing following, is utterly bad ; the anointing without the Bath is best of all. Besides, the anointing amongst them was used onely for *delicacy*, or (if you take it at the best) for *health*, but by no means in order to long life ; and therefore they used them with all precious Ointments, which were good for deliciousness, but hurtful to our intention, in regard of their heat : So that *Virgil* seemeth not to have said amiss,

— *Nec Casia liquidi corrumpitur usus Olivæ,*

That odoriferous *Casia* hath not supplanted the use of neat Oil-Olive.

Anointing with Oil conduceth to health, both in Winter, by the exclusion of the cold Air, and in Summer, by detaining the spirits within, and prohibiting the Resolution of them, and keeping off the force of the air which is then most predatory.

Seeing the anointing with Oil is one of the most potent operations to long life, we have thought good to add some cautions, lest the health should be endangered : They are four, according to the four *Inconveniences* which may follow thereupon.

The first *Inconvenience* is, that by repressing sweats, it may ingender diseases from those excrementitious humours. To this a remedy must be given by *Purges* and *Clysters*, that evacuation may be duly performed. This is certain, that evacuation by sweats commonly advanceth health, and derogateth from long life ; but gentle *Purgers* work upon the humours, not upon the spirits, as sweat doth.

The second *Inconvenience* is, that it may heat the body, and in time inflame it ; for the spirits shut in, and not breathing forth, acquire heat. This inconvenience may be prevented, if the Diet most usually incline to the colder part, and that at times some proper cooling Medicines be taken, of which we shall straight speak in the operation upon the blood.

The third is, that it may annoy the head ; for all *Oppletion* from without strikes back the vapours, and sends them up unto the head. This inconvenience is remedied by *Purgers*, especially *Clysters*, and by shutting the mouth of the stomach strongly with *Stipticks*, and by combing and rubbing the head, and by washing it with convenient *Lies*, that something may exhale, and by not omitting competent and good exercises, that something also may perspire by the skin.

25. The fourth *Inconvenience* is a more subtil Evil, namely, that the Spirit being detained by the closing up of the *Pores*, is likely to multiply it self too much; for when little issueth forth, and new Spirit is continually ingendred, the Spirit increaseth too fast, and so preyeth upon the body more plentifully. But this is not altogether so; for all Spirit closed up is dull, (for it is blown and excited with motion as Flame is) and therefore it is less active, and less generative of it self: Indeed it is thereby increased in Heat, (as Flame is) but flow in Motion. And therefore the remedy to this inconvenience must be by cold things, being sometimes mixed with *Oil*, such as are *Roses* and *Myrtles*; for we must altogether disclaim hot things, as we said of *Cassia*.
26. Neither will it be unprofitable to wear next the body Garments that have in them some *Unctuosity* or *Oleosity*, not *Aquosity*, for they will exhaust the body less; such as are those of Woollen rather than those of Linen. Certainly it is manifest in the Spirits of Odours, that if you lay sweet powders amongst Linen, they will much sooner lose their smell than amongst Woollen. And therefore Linen is to be preferred for delicacy and neatness, but to be suspected for our *Operation*.
27. The *wild Irish*, as soon as they fall sick, the first thing they do is to take the sheets off their beds, and to wrap themselves in the woollen cloaths.
28. Some report, that they have found great benefit in the conservation of their health by wearing *scarlet Wascots* next their skin, and under their shirts, as well down to the neather parts as on the upper.
29. It is also to be observed, that *Air* accustomed to the body doth less prey upon it than new *Air* and often changed; and therefore poor people, in small Cottages, who live always within the smell of the same chimney, and change not their seats, are commonly longest liv'd: notwithstanding, to other operations (especially for them whose spirits are not altogether dull) we judge change of air to be very profitable; but a mean must be used, which may satisfie on both sides. This may be done by removing our habitation four times a year, at constant and set times, unto convenient seats, that so the body may neither be in too much peregrination, nor in too much station. And touching the *Operation* upon the *Exclusion* of *Air*, and avoiding the predatory force thereof, thus much.

The Operation upon the Bloud, and the Sanguifying Heat. 3.

The History.

1. THE following *Operations* answer to the two precedent, and are in the relation of *Passives* and *Actives*: for the two precedent intend this, that the *Spirits* and *Air* in their actions may be the less deprederatory; and the two latter, that the *Bloud* and *Juice* of the body may be the less deprederable. But because the *Bloud* is an irrigation or watering of the *Juices* and *Members*, and a preparation to them, therefore we will put the operation upon the *Bloud* in the first place. Concerning this *Operation* we will propound certain Counseis, few in number, but very powerful in virtue. They are three.
2. First, there is no doubt, but that if the bloud be brought to a cold temper, it will be so much the less dissipable. But because the cold things which are taken by the mouth agree but ill with many other Intentions, therefore it will be best to find out some such things as may be free from these inconveniences. They are two.
3. The first is this: Let there be brought into use, especially in youth, *Clysters*, not *purging* at all, or *absterging*, but onely cooling, and somewhat opening: those are approved which are made of the *Juices* of *Lettuce*, *Purslane*, *Liver-wort*, *Houfseleek*, and the *Mucilage* of the seed of *Flea-wort*, with some temperate opening decoction, and a little

little *Camphire* : but in the declining age let the *Housleek* and *Purslane* be left out, and the juices of *Borrag* and *Endive*, and the like, be put in their rooms. And let these *Clysters* be retained, if it may be, for an hour or more.

The other is this, Let there be in use, especially in Summer, *Baths* of fresh water, and but luke-warm, altogether without *Emollients*, as *Mallows*, *Mercury*, *Milk*, and the like; rather take new *whay* in some good quantity, and *Roses*.

But (that which is the principal in this intention, and new) we advise that before the bathing of the body be anointed with Oil, with some *thickness*, whereby the quality of the cooling may be received, and the water excluded: yet let not the pores of the body be shut too close; for when the outward cold closeth up the body too strongly, it is so far from furthering coolness, that it rather forbids, and stirs up heat.

Like unto this is the use of *Bladders*, with some decoctions and cooling juices, applied to the inferiour region of the body, namely, from the ribs to the privy parts; for this also is a kind of *bathing*, where the body of the liquor is for the most part excluded, and the cooling quality admitted.

The third counsel remaineth, which belongeth not to the quality of the *blood*, but to the substance thereof, that it may be made more firm and less dissipable, and such, as the heat of the spirit may have the less power over it.

And as for the use of *Filings* of *Gold*, *Leaf-gold*, *Powder of Pearl*, *Precious stones*, *Coral*, and the like, we have no opinion of them at this day, unless it be onely as they may satisfie this present *Operation*. Certainly, seeing the *Arabians*, *Grecians*, and *modern Physicians* have attributed such virtues to these things, it cannot be altogether Nothing which so great men have observed of them. And therefore omitting all fantastical opinions about them, we do verily believe, that if there could be some such thing conveyed into the whole mass of the blood in minute and fine portions, over which the spirits and heat should have little or no power, absolutely it would not only resist *Putrefaction*, but *Arefaction* also, and be a most effectual means to the prolongation of life. Nevertheless in this thing several cautions are to be given. First, that there be a most exact comminution. Secondly, that such hard and solid things be void of all malignant qualities, lest while they be dispersed and lurk in the veins, they breed some ill convenience. Thirdly, that they be never taken together with meats, nor in any such manner as they may stick long, lest they beget dangerous obstructions about the *Mesentery*. Lastly, that they be taken very rarely, that they may not congregate and knot together in the veins.

Therefore let the manner of taking them be *fasting*, in *white wine*, a little *Oil of Almonds* mingled therewith, *Exercise* used immediately upon the taking of them.

The *Simples* which may satisfie this *Operation* are, in stead of all, *Gold*, *Pearls*, and *Coral*: for all *Metalls*, except *Gold*, are not without some malignant quality in the dissolutions of them, neither will they be beaten to that exquisite fineness that *Leaf-gold* hath. As for all *glassie* and *transparent Jewels*, we like them not, (as we said before) for fear of *Corrosion*.

But, in our judgment, the safer and more effectual way would be by the use of *Woods* in *Infusions* and *Decoctions*; for there is in them sufficient to cause *firmness* of *blood*, and not the like danger for breeding obstructions; but especially, because they may be taken in meat and drink, whereby they will find the more easie entrance into the veins, and not be avoided in excrements.

The *Woods* fit for this purpose are *Sanders*, the *Oak* and *Vine*. As for all *hot woods* or something *Rosennie*, we reject them: notwithstanding you may adde the *woody stalks* of *Rosemary* dried, for *Rosemary* is a *Shrub*, and exceedeth in age many *Trees*; also the *woody stalks* of *Ivy*, but in such quantity as they may not yield an unpleasing taste.

Let the *Woods* be taken either boiled in *Broths*, or infused in *Must* or *Ale* before they leave working: but in *Broths* (as the custom is for *Guaiacum* and the like) they would be infused a good while before the boiling, that the firmer part of the *wood*, and not that onely which lieth loosely, may be drawn forth. As for *Ash*, though it be used for *Cups*, yet we like it not. And touching the *Operation* upon the *Blond* thus much.

The Operation upon the Juices of the Body. 4.

The History.

1. **T**Here are two kinds of *Bodies* (as was said before in the *Inquisition* touching *Inanimates*) which are hardly consumed, *Hard* things and *Fat* things; as is seen in *Metalls* and *Stones*, and in *Oil* and *wax*.
2. It must be ordered therefore, that the *juice* of the *body* be somewhat *hard*, and that it be *fatty* or *subrosid*.
3. As for *hardness*, it is caused three ways: by *Aliment* of a *firm* nature, by *cold* condensing the *skin* and *flesh*, and by *Exercise*, binding and compacting the *juices* of the *body*, that they be not *soft* and *frothy*.
4. As for the *Nature* of the *Aliment*, it ought to be such as is not easily *dissipable*; such as are *Beef*, *Swine's flesh*, *Dear*, *Goat*, *Kid*, *Swan*, *Goose*, *Ring-dove*, especially if they be a little *powdred*; *Fish* likewise *salted* and *dried*, *Old Cheese*, and the like.
5. As for the *Bread*; *Oaten-bread*, or *bread* with some mixture of *Pease* in it, or *Rye-bread*, or *Early-bread*, are more *solid* than *wheat-bread*, and in *wheat-bread*, the course *wheat-bread* is more *solid* than the pure *Manchet*.
6. The *Inhabitants* of the *Orcades*, which live upon *salted fish*, and generally all *Fish-eaters*, are long *liv'd*.
7. The *Monks* and *Hermites* which fed sparingly, and upon *dry Aliment*, attained commonly to a *great age*.
8. Also *pure water* usually drunk makes the *juices* of the *body* less *frothy*? unto which if, for the *dulness* of the *spirits*, (which no doubt in *Water* are but a little *penetrative*) you shall adde a little *Nitre*, we conceive it would be very good. And touching the *firmness* of the *Aliment* thus much.
9. As for the *Condensation* of the *skin* and *flesh* by *cold*: They are longer *liv'd* for the most part that live abroad in the *open air*, than they that live in *Houses*; and the *Inhabitants* of the *cold countries*, than the *Inhabitants* of the *hot*.
10. Great store of *clothes*, either upon the *bed* or *back*, do resolve the *body*.
11. Washing the *body* in *cold water* is good for length of *life*; use of *hot Baths* is naught. Touching *Baths* of *Astringent Mineral Waters* we have spoken before.
12. As for *Exercise*; an *idle life* doth manifestly make the *flesh* *soft* and *dissipable*: *robust exercise* (so it be without *over-much sweating* or *weariness*) maketh it *hard* and *compact*. Also *exercise* within *cold Water*, as *swimming*, is very good; and generally *exercise* abroad is better than that within *houses*.
13. Touching *Frications*, (which are a kind of *exercise*) because they do rather call forth the *Aliment* than *harden* the *flesh*, we will inquire hereafter in the due place.
14. Having now spoken of *hardning* the *juices* of the *body*, we are to come next to the *Oleosity* and *Fattiness* of them, which is a more perfect and potent *Intention* than *Induration*, because it hath no *inconvenience* or *evil* annexed. For all those things which pertain to the *hardning* of the *juices* are of that nature, that while they prohibit the *absumption* of the *Aliment*, they also hinder the operation of the same; whereby it happens, that the same things are both *propitious* and *adverse* to length of *life*: but those things which pertain to making the *Juices* *Oily* and *Roscid*, help on both sides, for they render the *Aliment* both less *dissipable*, and more *reparable*.
15. But whereas we say that the *Juice* of the *body* ought to be *Roscid* and *Fat*, it is to be noted that we mean it not of a *visible Fat*, but of a *Dewiness* dispersed, or (if you will call it) *Radical* in the very substance of the *body*.
16. Neither again let any man think, that *Oil* or the *Fat* of *Meats* or *Marrow* do engender the like, and satisfy our *intention*: for those things which are once perfect are not brought back again; but the *Aliments* ought to be such, which after *digestion* and *maturation* do then in the end engender *Oleosity* in the *Juices*.
17. Neither again let any man think, that *Oil* or *Fat* by it self and simple is hard of *dissipation*, but in mixture it doth not retain the same nature: for as *Oil* by it self is much more longer in consuming than *Water*; so in *Paper* or *Linnen* it sticketh longer, and is later *dried*, as we noted before.

To the Irroration of the body, roasted meats or baked meats are more effectual than boiled meats, and all preparation of meat with water is inconvenient: besides, Oils more plentifully extracted out of drie bodies than out of moist bodies.

Generally, to the Irroration of the body much use of sweet things is profitable, as of Sugar, Honey, sweet Almonds, Pine-Apples, Pistachio's, Dates, Raisins of the Sun, Corans, Figs, and the like. Contrarily, all four, and very salt, and very biting things are opposite to the generation of Roscid Juice.

Neither would we be thought to favour the Manichees, or their diet, though we commend the frequent use of all kinds of Seeds, Kernels, and Roots, in Meats or Sauces, considering all Bread (and Bread is that which maketh the Meat firm) is made either of Seeds or Roots.

But there is nothing makes so much to the Irroration of the body, as the quality of the Drink, which is the convoy of the Meat; therefore let there be in use such Drinks as without all acrimony or fownness are notwithstanding subtil: such are those Wines which are (as the old woman said in *Plautus*) *vetustate edentula*, toothless with age, and Ale of the same kind.

Mead (as we suppose) would not be ill if it were strong and old: but because all Honey hath in it some sharp parts, (as appears by that sharp water which the Chymists extract out of it, which will dissolve metals) it were better to take the same portion of Sugar, not lightly infused in it, but so incorporated as Honey useth to be in Mead, and to keep it to the age of a year, or at least six months, whereby the Water may lose the crudity, and the Sugar acquire subtilty.

Now ancientness in Wine or Beer hath this in it, that it ingenders subtilty in the parts of the Liquor, and acrimony in the Spirits, whereof the first is profitable, and the second hurtful. Now to rectifie this evil commixture, let there be put into the vessel, before the Wine be separated from the Must, *Swines-flesh* or *Deers-flesh* well boiled, that the Spirits of the Wine may have whereupon to ruminare and feed, and so lay aside their mordacity.

In like manner, if Ale should be made not only with the grains of Wheat, Barly, Oates, Pease, and the like; but also should admit a part (suppose a third part to these grains) of some fat roots, such as are *Potado-roots*, *Pith of Artichokes*, *Burre-roots*, or some other sweet and esculent roots; we suppose it would be a more useful drink for long life than Ale made of grains onely.

Also such things as have very thin parts, yet notwithstanding are without all acrimony or mordacity, are very good Sallets: which vertue we find to be in some few of the Flowers; namely, Flowers of *Ivy*, which infused in Vinegar are pleasant even to the taste; *Marigold leaves*, which are used in Broths; and Flowers of *Betony*. And touching the operation upon the Juices of the Body thus much.

The Operation upon the Bowels for their Extrusion of Aliment. 5.

The History.

What those things are which comfort the Principal Bowels, which are the fountains of Concoctions, namely, the *Stomack*, *Liver*, *Heart* and *Brain*; to perform their functions well, (whereby Aliment is distributed into the parts, Spirits are dispersed, and the Reparation of the whole body is accomplished) may be derived from Physicians, and from their Prescripts, and Advices.

Touching the *Spleen*, *Gall*, *Kidneys*, *Mesenteries*, *Guts* and *Lungs*, we speak not, for these are members ministring to the principal; and whereas speech is made touching health, they require sometime a most special consideration, because each of these have their diseases, which unless they be cured, will have influence upon the Principal Members. But as touching the prolongation of life, and reparation by aliments, and retardation of the concoction of old age; if the Concoctions and

those *principal Bowels* be well disposed, the rest will commonly follow according to ones wish.

3. And as for those things which, according to the different state of every man's body may be transferred into his Diet and the regiment of his life, he may collect them out of the Books of Physicians, which have written of the comforting and preserving the four *Principal Members*: For conservation of health hath commonly need of no more than some short courses of Physick; but length of life cannot be hoped without an orderly diet, and a constant race of *sovereign Medicines*. But we will propound some few, and those the most select and prime directions.
4. The *Stomach* (which, as they say, is the Master of the house, and whose strength and goodness is fundamental to the other concoctions) ought so to be guarded and confirmed, that it may be without *intemperateness* hot; next *astricted* or bound, not loose; furthermore *clean*, not surcharged with foul Humours, and yet (in regard it is nourished from it self, not from the veins) not altogether *empty* or *hungry*: lastly, it is to be kept ever in *appetite*, because *appetite* sharpens digestion.
5. I wonder much how that same *Calidum bibere*, to drink warm drink, (which was in use amongst the Ancients) is laid down again. I knew a Physician that was very famous, who in the beginning of dinner and supper, would usually eat a few spoonfulls of very warm *broth* with much greediness, and then would presently wish that it were out again, saying, *He had no need of the broth, but only of the warmth*.
6. I do verily conceive it good, that the first draught either of *wine*, or *Ale*, or any other *drink*, (to which a man is most accustomed) be taken at supper *warm*.
7. *wine* in which *Gold* hath been quenched, I conceive, would be very good once in a meal; not that I believe the *Gold* conferreth any vertue thereunto, but that I know that the quenching of all Metals in any kind of liquor doth leave a most potent *Astriction*: Now I chuse *Gold*, because besides that *Astriction* which I desire, it leaveth nothing else behind it of a metalline impression.
8. I am of opinion, that the sops of bread dipped in wine, taken at the midst of the meal, are better than wine it self; especially if there were infused into the wine in which the sops were dipped *Rosemary* and *Citron-pill*, and that with *Sugar*, that it may not slip too fast.
9. It is certain that the use of *Quinces* is good to strengthen the stomach; but we take them to be better if they be used in that which they call *Quiddeny* of *Quinces*, than in the bodies of the *Quinces* themselves, because they lie heavy in the stomach. But those *Quiddeny*s are best taken after meals, alone; before meals, dipped in *Vinegar*.
10. Such things as are good for the stomach above other Simples are these, *Rosemary*, *Elecampane*, *Mastick*, *wormwood*, *Sage*, *Mint*.
11. I allow Pills of *Aloes*, *Mastick* and *Saffron* in Winter-time, taken before dinner; but so, as the *Aloes* be not only oftentimes washed in *Rose-water*, but also in *Vinegar* in which *Tragacanth* hath been infused, and after that be macerated for a few hours in Oil of sweet *Almonds* new drawn, before it be made into Pills.
12. *wine* or *Ale* wherein *wormwood* hath been infused, with a little *Elecampane* and yellow *Sanders*, will do well, taken at times, and that especially in Winter.
13. But in Summer, a draught of *white-wine* allayed with *strawberry-water*, in which Wine Powder of Pearls and of the shells of *cra-fishes* exquisitely beaten and (which may perhaps seem strange) a little *chalk* have been infused, doth excellently refresh and strengthen the stomach.
14. But generally, all *Draughts* in the morning (which are but too frequently used) of *cooling* things, as of Juices, Decoctions, Whey, Barly-waters, and the like) are to be avoided, and nothing is to be put into the stomach fasting which is purely *cold*. These things are better given, if need require, either at five in the afternoon, or else an hour after a light breakfast.
15. Often fastings are bad for long life; besides, all thirst is to be avoided, and the stomach is to be kept clean, but always moist.
16. Oil of *Olives* new and good, in which a little *Methridate* hath been dissolved, anointed upon the back-bone, just against the mouth of the stomach, doth wonderfully comfort the stomach.
17. A small bag filled with locks of Scarlet-wool steeped in Red-wine, in which
Myrtle,

Myrtle, and *Citron-pill*, and a little *safron* have been infused, may be always worn upon the stomach. And touching those things which comfort the stomach thus much, seeing many of those things also which serve for other operations are helpful to this.

The *Liver*, if it be preserved from *Torrefaction*, or *Desiccation*, and from *Obstruction*, it needeth no more; for that looseness of it which begets *Aquosities* is plainly a disease, but the other two old age approaching induceth.

Hereunto appertain most especially those things which are set down in the *Operation upon the Blood*: we will adde a very few things more, but those selected.

Principally let there be in use the *Wine of sweet Pomegranats*, or, if that cannot be had, the juice of them newly expressed; let it be taken in the morning with a little *sugar*, and into the glass into which the Expression is made put a small piece of *Citron-pill green*, and three or four whole *Cloves*: let this be taken from *February* till the end of *April*.

Bring also into use above all other Herbs *Water-cresses*, but young, not old; they may be used either raw in *Sallets*, or in *Broths*, or in *Drinks*: and after that take *Spoon-wort*.

Aloes, however washed or corrected, is hurtful for the *Liver*, and therefore it is never to be taken ordinarily. Contrariwise, *Rhubarb* is sovereign for the *Liver*, so that these three cautions be interposed. First, that it be taken before meat, lest it dry the body too much, or leave some impressions of the *Stipicity* thereof. Secondly, that it be macerated an hour or two in *Oil of sweet Almonds* new drawn, with *Rose-water*, before it be infused in *Liquor*, or given in the proper substance. Thirdly, that it be taken by turns, one while simple, another while with *Tartar*, or a little *Bay-salt*, that it carry not away the lighter parts onely, and make the mass of the *Humours* more obstinate.

I allow *Wine*, or some decoction with *Steel*, to be taken three or four times in the year, to open the more strong obstructions; yet so, that a draught of two or three spoonfuls of *Oil of sweet Almonds* new drawn ever go before, and the motion of the Body, especially of the arms and sides, constantly follow.

Sweetned Liquors, and that with some fatness, are principally, and not a little effectual to prevent the *Arefaction*, and *Saltiness*, and *Torrefaction*, and in a word, the *Oldness* of the *Liver*, especially if they be well incorporated with age. They are made of sweet Fruits and Roots, as namely, the *Wines* and *Julips* of *Raisins* of the *Sun* new, *Fujubae*, *dried Figs*, *Dates*, *Parsnips*, *Potatoes*, and the like, with the mixture of *Licoris* sometimes: also a *Julip* of the *Indian grain*, (which they call *Maiz*) with the mixture of some sweet things, doth much to the same end. But it is to be noted, that the intention of preserving the *Liver* in a kind of softness and fatness, is much more powerful than that other which pertains to the opening of the *Liver*, which rather tendeth to health than to length of life, saving that that *Obstruction* which induceth *Torrefaction* is as opposite to long life as those other *Arefactions*.

I commend the *Roots of succory*, *spinage* and *Beets* cleared of their piths, and boiled till they be tender in *Water*, with a third part of *White-wine*, for ordinary *Sallets*, to be eaten with *Oil* and *Vinegar*: also *Sparagus*, pith of *Artichokes*, and *Burre-roots* boiled and served in after the same manner; also *Broths* in the *Spring-time* of *Vine-buds*, and the green blades of *wheat*. And touching the preserving of the *Liver* thus much.

The *Heart* receiveth benefit or harm most from the *Air* which we breath, from *Vapours*, and from the *Affections*. Now many of those things which have been formerly spoken touching the *Spirits* may be transferred hither; but that indigested mass of *Cordials* collected by physicians avails little to our intention: notwithstanding those things which are found to be good against *Poysons* may with good judgment be given to strengthen and fortifie the *Heart*, especially if they be of that kind, that they do not so much resist the particular *poysons* as arm the heart and spirits against *poyson* in general. And touching the several *Cordials*, you may repair to the *Table* already set down.

The goodness of the *Air* is better known by experience than by signs. We hold that *Air* to be best where the *Country* is level and plain, and that lieth open on all sides, so that the soil be dry, and yet not barren or sandy; which puts forth

17.

19.

20.

21.

22.

23.

24.

25.

26.

27.

Wild Thyme, and *Eye-bright*, and a kind of *Marjoram*, and here and there stalks of *Calamint*; which is not altogether void of wood, but conveniently set with some Trees for shade; where the *Sweet-briar-rose* smelleth something Musky and Aromatically. If there be *Rivers*, we suppose them rather hurtful than good, unless they be very small, and clear, and gravelly.

28. It is certain that the *morning air* is more lively and refreshing than the *evening air*, though the latter be prefer'd out of delicacy.

29. We conceive also, that the *air stirred* with a *gentle wind* is more wholesome than the *air* of a *serene* and *calm skie*; but the best is, the *wind* blowing from the *West* in the morning, and from the *North* in the afternoon.

30. *Odours* are especially profitable for the comforting of the *heart*, yet not so as though a good *odour* were the prerogative of a good *air*: for it is certain, that as there are some *Pestilential airs* which smell not so ill as others that are less hurtful; so, on the contrary, there are some *airs* most wholesome and friendly to the *spirits*, which either smell not at all, or are less pleasing and fragrant to the sense. And generally, where the *air* is good, *odours* should be taken but now and then; for a continual *odour*, though never to good, is burthensome to the *spirits*.

31. We commend above all others (as we have touched before) *odour* of *Plants*, growing, and not *plucked*, taken in the open *air*: the principal of that kind are *Violets*, *Gilliflowers*, *Pinks*, *Bean-flowers*, *Lime-tree-blossoms*, *Vine-buds*, *Honey-suckles*, *yellow Wall-flowers*, *Musk-Roses*, (for other *Roses* growing are fast of their smells) *Strawberry-leaves*, especially *dying*, *Sweet-briar*, principally in the early Spring, *wild Mint*, *Lavender flowered*; and in the hotter Countries, *Orange-tree*, *Citron-tree*, *Myrtle*, *Laurel*: Therefore to walk or sit near the breath of these *Plants* would not be neglected.

32. For the comforting of the *Heart*, we prefer cool smells before hot smells: therefore the best perfume is, either in the morning, or about the heat of the day, to take an equal portion of *Vinegar*, *Rose-water*, and *claret-wine*, and to pour them upon a Fire-pan somewhat heated.

33. Neither let us be thought to sacrifice to our Mother the *Earth*, though we advise, that in *digging* or *ploughing* the *Earth* for health, a quantity of *claret-wine* be poured thereon.

34. *Orange-flower-water*, pure and good, with a small portion of *Rose-water* and *brisk wine*, snuffed up into the nostrils, or put into the nostrills with a *syringe*, after the manner of an *Errhine*, (but not too frequently) is very good.

35. But *champing* (though we have no *Betel*) or holding in the mouth onely of such things as cheer the *Spirits*, (even daily done) is exceeding comfortable. Therefore for that purpose make *Grains* or little *cakes* of *Amber-greece*, *Musk*, *Lignum-Aloes*, *Lignum Rhodium*, *Orris Powder*, and *Roses*; and let those *Grains* or *Cakes* be made up with *Rose-water* which hath passed through a little *Indian Balsam*.

36. The *Vapours* which arising from things inwardly taken do fortifie and cherish the *heart* ought to have these three properties, that they be Friendly, Clear, and Cooling; for hot *vapours* are naught, and *vine* it self, which is thought to have onely an heating *vapour*, is not altogether void of an *Opiate quality*. Now we call those *vapours* Clear which have more of the *vapour* than of the *exhalation*, and which are not smoaky, or fuliginous, or unctuous, but moist and equal.

37. Out of that unprofitable rabble of *cordials*, a few ought to be taken into daily diet: instead of all, *Amber-greece*, *Saffron*, and the grain of *Kermes*, of the hotter sort; Roots of *Bugloss* and *Borrag*, *Citrons*, *Sweet Limons*, and *Pearmains*, of the colder sort. Also that way which we said, both *Gold* and *Pearls* work a good effect, not onely within the veins, but in their passage, and about the parts near the heart; namely, by cooling, without any malignant quality.

38. Of *Bezoar-stone* we believe well, because of many trials: but then the manner of taking it ought to be such, as the vertue thereof may more easily be communicated to the *spirits*: therefore we approve not the taking of it in *Brotks* or *Syrups*, or in *Rose-water*, or any such like; but onely in *wine*, *Cinnamon-water*, or the like distilled water, but that weak or small, not burning or strong.

39. Of the *Affections* we have spoken before; we onely adde this, That every *Noble*, and *Resolute*, and (as they call it) *Heroical Desire*, strengtheth and enlargeth the powers of the *Heart*. And touching the *Heart* thus much.

As for the *Brain*, where the Seat and Court of the *Animal Spirits* is kept, those things which were inquired before touching *Opium*, and *Nitre*, and the *Subordinates* to them both, also touching the *procuring of placid sleep*, may likewise be referred hither. This also is most certain, that the *Brain* is in some sort in the custody of the *Stomach*; and therefore those things which comfort and strengthen the *Stomach* do help the *Brain* by consent, and may no less be transferred hither. We will adde a few Observations; three Outward, one Inward.

40.

We would have *bathing* of the *Feet* to be often used, at least once in a week: and the *Bath* to be made of *Lye* with *Bay-salt*, and a little *Sage*, *Chamomile*, *Fennel*, *Sweet-marjoram*, and *Pepper-wort*, with the leaves of *Angelica* green.

41.

We commend also a *Fume* or *Suffumigation* every morning of dried *Rosemary*, *Bay-leaves* dried, and *Lignum-Aloes*: for all sweet *Gums* oppres the head.

42.

Especially care must be taken that no *hot things* be applied to the *Head* outwardly; such are all kind of *Spices*, the very *Nutmeg* not excepted: for those hot things we debase them to the soles of the *Feet*, and would have them applied there onely; but a light anointing of the *Head* with *Oil*, mixed with *Roses*, *Myrtle*, and a little *Salt* and *Saffron*, we much commend.

43.

Not forgetting those things which we have before delivered touching *Opiates*, *Nitre*, and the like, which so much *condense* the *Spirits*; we think it not impertinent to that effect, that once in fourteen days *broth* be taken in the morning with three or four grains of *Castoreum*, and a little *Angelica-seed*, and *Calamus*, which both fortifie the *Brain*, and in that afore said density of the substance of the *Spirits*, (so necessary to long life) adde also a *vivacity* of *motion* and *vigour* to them.

44.

In handling the *Comforters* of the four *principal Bowels*, we have propounded those things which are both proper and choice, and may safely and conveniently be transferred into *Diets* and *Regiment of Life*: for variety of *Medicines* is the *Daughter* of *Ignorance*; and it is not more true, that *many Dishes* have caused *many Diseases*, as the *Proverb* is, than this is true, that *many Medicines* have caused *few Cures*. And touching the *Operation* upon the *principal Bowels* for their *Extrusion* of *Aliment*, thus much.

45.

The Operation upon the Outward Parts for their Attraction of Aliment. 6.

The History.

Although a good *Concoction* performed by the *Inward Parts* be the principal towards a perfect *Alimentation*; yet the *Actions* of the *Outward Parts* ought also to concur; that like as the *Inward Faculty* sendeth forth and extrudeth the *Aliment*, so the *Faculty* of the *Outward Parts* may call forth and attract the same: and the more weak the *Faculty* of *Concoction* shall be, the more need is there of a concurring help of the *Attractive Faculty*.

26

A *strong Attraction* of the *outward parts* is chiefly caused by the motion of the *Body*, by which the parts being heated and comforted, do more chearfully call forth and attract the *Aliment* unto themselves.

27

But this is most of all to be foreseen and avoided, that the same motion and heat which calls the new juice to the members, doth not again despoil the member of that juice wherewith it had been before refreshed.

28

Frications used in the morning serve especially to this *Intention*: but this must evermore accompany them, that after the *Frication* the part be lightly anointed with *Oil*, lest the *Attrition* of the *outward parts* make them by *Perspiration* dry and juiceless.

29

The next is *Exercise*, (by which the parts confricate and chafe themselves) so it

30

be moderate, and which (as was noted before) is not swift, nor to the utmost strength, nor unto weariness. But in *Exercise* and *Frication* there is the same reason and caution, that the body may not perspire or exhale too much : Therefore *Exercise* is better in the open air than in the house, and better in Winter than in Summer ; and again, *Exercise* is not onely to be concluded with *Unction*, as *Frication* is, but in vehement *Exercises* *Unction* is to be used both in the beginning and in the end, as it was anciently to *Champions*.

6. That *Exercise* may resolve either the spirits or the juices as little as may be, it is necessary that it be used when the stomach is not altogether empty : and therefore that it may not be used upon a full stomach, (which doth much concern health) nor yet upon an empty stomach, (which doth no less concern long life) it is best to take a breakfast in the morning, not of any Physical Drugs, or of any Liquors or of Raisins, or of Figs, or the like ; but of plain Meat and Drink, yet that very light, and in moderate quantity.
7. *Exercises* used for the irrigation of the members, ought to be equal to all the members ; not (as *Socrates* said) that the *Legs* should move, and the *Arms* should rest, or on the contrary ; but that all the parts may participate of the motion. And it is altogether requisite to long life, that the Body should never abide long in one posture, but that every half hour, at least, it change the posture, saving onely in sleep.
8. Those things which are used to *Mortification* may be transferred to *Vivification* : for both Hair shirts, and Scourgings, and all vexations of the outward parts, do fortifie the Attractive force of them.
9. *Cardan* commends *Nettling*, even to let out *Melancholly* : but of this we have no experience ; and besides, we have no good opinion of it, lest, through the venomous quality of the *Nettle*, it may with often use breed Itches and other diseases of the skin. And touching the *Operation* upon the *Outward Parts* for their *Attraction* of *Aliment*, thus much.

The Operation upon the Aliment it self for the Insinuation thereof. 7.

The History.

1. **T**He vulgar reproof touching many Dishes doth rather become severe Reformer than a *Physician* ; or howsoever it may be good for preservation of health, yet it is hurtful to length of life, by reason that a various mixture of Aliments, and somewhat heterogeneous, finds a passage into the veins and juices of the body more lively and chearfully than a simple and homogeneous diet doth : besides, it is more forcible to stir up *Appetite*, which is the spur of *Digestion*. Therefore we allow both a *full Table*, and a *continual changing of Dishes*, according to the Seasons of the year, or upon other occasions.
2. Also that opinion of the *Simplicity* of *Meats* without *Sawces* is but a simplicity of judgment ; for good and well-chosen *sawces* are the most wholesome preparation of *Meats*, and conduce both to health and to long life.
3. It must be ordered, that with Meats hard of digestion be conjoynd strong Liquors and Sawces that may penetrate and make way ; but with Meats more easie of digestion, smaller Liquors and fat Sawces.
4. Whereas we advised before, that the first Draught at *Supper* should be taken warm ; now we adde, that for the preparation of the stomach, a good draught of that Liquor (to which every man is most accustomed) be taken warm half an hour before meat also, but a little spiced, to please the taste.
5. The preparation of Meats, and Bread, and Drinks, that they may be rightly handled, and in order to this Intention, is of exceeding great moment howsoever it may seem a Mechanical thing, and favouring of the Kitchin and Buttery ; yet it is of more consequence than those Fables of Gold and precious Stones, and the like.

The moistning of the juices of the body by a moist preparation of the aliment, is a childish thing ; it may be somewhat available against the fervours of diseases, but it is altogether averse to roscid alimentation. Therefore boiling of meats, as concerning our Intention, is far inferiour to roasting, and baking, and the like.

6.

Roasting ought to be with a quick fire, and soon dispatched ; not with a dull fire, and in long time.

7.

All solid fleshes ought to be served in, not altogether fresh, but somewhat powdered or corned ; the less Salt may be spent at the table with them, or none at all : for Salt incorporated with the meat before is better distributed in the body, then eaten with it at the table.

8.

There would be brought into use several and good *Macerations*, and *Infusions* of *Meats* in convenient Liquors, before the roasting of them : the like whereof are sometime in use before they bake them, and in the Pickles of some Fishes.

9.

But *beatings*, and as it were *scourgings*, of flesh-meats before they be boiled, would work no small matter. We see it is confessed that *Partridges* and *Pheasants* killed with an *Hawk*, also *Bucks* and *Stags* killed in *Hunting*, (if they stand not out too long, eat better even to the taste ; and some *Fishes* scourged and beaten, become more tender and wholesome ; also hard and sour *Pears*, and some other Fruits, grow sweet with rowling them. It were good to practise some such beating and bruising of the harder kinds of Fleshes before they be brought to the fire ; and this would be one of the best preparations of all.

10.

Bread a little leavened, and very little salted, is best, and which is baked in an Oven thoroughly heated, and not with a faint heat.

11.

The preparation of Drinks in order to long life shall not exceed one Precept. And as touching *water-drinkers* we have nothing to say ; such a diet (as we said before) may prolong life to an indifferent term, but to no eminent length : but in other Drinks, that are full of spirit, (such as are *wine*, *Ale*, *Mead*, and the like) this one thing is to be observed and pursued, as the sum of all, That the parts of the *Liquor* may be exceeding thin and subtil, and the *Spirit* exceeding mild. This is hard to be done by *Age* alone, for that makes the parts a little more subtil, but the spirits much more sharp and eager : therefore of the *Infusions* in the Vessels of some fat substance, which may restrain the acrimony of the spirits, counsel hath been given before. There is also another way without *Infusion* or *Mixture* : this is, that the Liquor might be continually agitated, either by carriage upon the Water, or by carriage by Land, or by hanging the vessels upon lines, and daily stirring them, or some such other way : for it is certain that this *local motion* doth both subtilize the parts, and doth so incorporate and compact the spirits with the parts, that they have no leisure to turn to sourness, which is a kind of *putrefaction*.

12.

But in extream *old age* such a preparation of meats is to be made as may be almost in the middle way to *chylus*. And touching the *Distillations* of *Meats*, they are mere toys ; for the Nutritive part, at least the best of it, doth not ascend in *Vapours*.

13.

The incorporating of meat and drink before they meet in the stomach is a degree to *chylus* : therefore let *Chickens*, or *Partridges*, or *Pheasants*, or the like, be taken and boiled in water with a little salt, then let them be cleansed and dried, afterward let them be infused in *Must* or *Ale* before it hath done working, with a little *Sugar*.

14.

Also *Grazies* of meat, and the *mincings* of them small well season'd, are good for *old persons* ; and the rather, for that they are destituted of the office of their *Teeth* in chewing, which is a principal kind of preparation.

15.

And as for the helps of that defect, (namely, of the strength of *Teeth* to grind the meat) there are three things which may conduce thereunto. First, that new *Teeth* may put forth ; that which seems altogether difficult, and cannot be accomplished without an inward and powerful restauration of the body. Secondly, that the *Jaws* be so confirmed by due *Astringents*, that they may in some sort supply the office of the *Teeth* ; which may possibly be effected. Thirdly, that the meat be so prepared, that there shall be no need of chewing : which remedy is ready at hand.

16.

We have some thought also touching the *Quantity* of the meat and drink, that the same taken in a larger quantity at some times is good for the *irrigation* of the body : therefore both *great Feastings* and *free Drinkings* are not altogether to be inhibited. And touching the *Operation* upon the *Aliments* and the *Preparation* of them, thus much.

17.

The Operation upon the last Act of Assimilation. 8.

Touching the last Act of Assimilation (unto which the three Operations immediately preceding chiefly tend) our advice shall be brief and single: and the thing it self rather needs Explication, than any various Rules.

1. **I**T is certain, that all bodies are endued with some desire of *Assimilating* those things which are next them. This the rare and pneumatical bodies, as *Flame, Spirit, Air,* perform generously and with alacrity: on the contrary, those that carry a gross and tangible bulk about them, do but weakly, in regard that the desire of *assimilating* other things is bound in by a stronger desire of *Rest*, and containing themselves from *Motion*.
2. Again, it is certain that the desire of *assimilating* being bound, as we said, in a Gross body, and made uneffectual, is somewhat freed and stirred up by the *heat* and *neighbouring spirit*, so that it is then actuated: which is the onely cause why *Inanimates assimilate not*, and *Animates assimilate*.
3. This also is certain, that the harder the Consistence of the body is, the more doth that body stand in need of a greater heat to prick forward the *assimilation*: which falls out ill for old men, because in them the parts are more obstinate, and the heat weaker; and therefore either the obstinacy of their parts is to be softned, or their heat increased. And as touching the *Malacissation* or *mollifying* of the members, we shall speak afterward, having also formerly propounded many things which pertain to the prohibiting and preventing of this kind of hardness. For the other, touching the increasing of the heat, we will now deliver a single precept, after we have first assumed this *Axiom*.
4. The *Act* of *assimilation* (which, as we said, is excited by the heat circumfused) is a motion exceeding accurate, subtile, and in little; now all such motions do then come to their vigour, when the *local Motion* wholly ceaseth which disturbeth it. For the *Motion* of *Separation* into *homogeneous* parts, which is in Milk, that the Cream should swim above, and the Whey sink to the bottom, will never work, if the Milk be never so little agitated; neither will any *Putrefaction* proceed in Water or mixt Bodies, if the same be in continual *Local Motion*. So then, from this *Assumption* we will conclude this for the present Inquisition.
5. The *Act* it self of *Assimilation* is chiefly accomplished in Sleep and Rest, especially towards the morning, the distribution being finished. Therefore we have nothing else to advise, but that men keep themselves hot in their sleep; and further, that towards the morning there be used some Anointing, or shirt tincted with Oil, such as may gently stir up heat, and after that to fall asleep again. And touching the last *Act* of *Assimilation* thus much.

The Operation upon the Inteneration of that which begins to be Aresied, or the Malacissation of the Body. 9.

WE have inquired formerly touching the Inteneration from within, which is done by many windings and Circuits, as well of Alimentation as of Detaining the Spirit from issuing forth, and therefore is accomplished slowly. Now we are to inquire touching that Inteneration which is from without, and is effected, as it were, suddenly; or touching the Malacissation and Suppling of the Body.

The History.

1. **I**N the Fable of restoring *Pelias* to youth again, *Medea*, when she feigned to do it propounded this way of accomplishing the same, That the Old man's body should be cut into several pieces, and then boiled in a Cauldron with certain Medicaments. There may, perhaps, some boiling be required to this matter, but the cutting into pieces is not needful.

Notwithstanding, this cutting into pieces seems, in some sort, to be useful; not with a knife, but with judgment. For whereas the Consistence of the *Bowels* and *Parts* is very diverse, it is needfull that the *Inteneration* of them both be not effected the same way, but that there be a Cure designed of each in particular, besides those things which pertain to the Inteneration of the whole mass of the Body; of which, notwithstanding, in the first place.

This *Operation* (if perhaps it be within our power) is most likely to be done by Baths, Unctions, and the like; concerning which these things that follow are to be observed.

We must not be too forward in hoping to accomplish this matter from the Examples of those things which we see done in the *Imbibitions* and *Macerations* of *Inanimates*, by which they are intenerated, whereof we introduced some instances before: For this kind of operation is more easie upon *Inanimates*, because they attract and suck in the Liquor; but upon the bodies of Living creatures it is harder, because in them the motion rather tendeth outward and to the *Circumference*.

Therefore the *Emollient Baths* which are in use do little good, but on the contrary hurt, because they rather draw forth than make entrance, and resolve the structure of the body rather than consolidate it.

The *Baths* and *Unctions* which may serve to the present *Operation* (namely, of *Intenerating* the body truly and really) ought to have three properties.

The first and principal is, That they consist of those *things* which in their whole substance are like unto the *body* and *flesh* of *man*, and which have a *feeding* and *nursing* virtue from without.

The second is, That they be mixed with such things as through the *subtily* of their parts may *make entrance*, and so insinuate and convey their *nourishing* virtue into the *body*.

The third is, That they receive some *mixture* (though much inferiour to the rest) of such things as are *Astringent*; I mean not sour or tart things, but unctuous and comforting; that while the other two do operate, the exhaling out of the body, which destroyeth the virtue of the things *intenerating*, may (as much as is possible) be prohibited; and the motion to the inward parts, by the *Astriction* of the skin and closing of the passages, may be promoted and furthered.

That which is most *consubstantial* to the body of man is *warm Blood*, either of man, or of some other living creature: but the device of *Ficinus*, touching the sucking of blood out of the arm of a wholesome young man, for the restauration of strength in old men, is very frivolous; for that which nourisheth from within ought no way to be equal or homogeneal to the body nourished, but in some sort inferiour and subordinate, that it may be converted: but in things applied outwardly, by how much the *substance* is *liker*, by so much the *consent* is *better*.

It hath been anciently received, that a *Bath* made of the *blood* of *Infants* will cure the *Lepresse*, and heal the flesh already putrefi'd; insomuch that this thing hath begot envy towards some *Kings* from the common people.

It is reported that *Heraclitus*, for cure of the *Dropsie*, was put into the *warm belly* of an *Ox* newly slain.

They use the *blood* of *Kittens* warm to cure the *disease* called *St. Anthony's Fire*, and to restore the flesh and skin.

An *Arm* or other *Member* newly cut off, or that upon some other occasion will not leave *bleeding*, is with good success put into the *belly* of some *creatures* newly *ripped up*, for it worketh potently to stanch the *blood*; the *blood* of the member cut off by consent sucking in, and vehemently drawing to it self, the *warm blood* of the creature slain, whereby it self is stopped and retireth.

It is much used in extreme and desperate *diseases* to cut in two *young Pigeons*, yet living, and apply them to the *soles* of the *feet*, and to shift them one after another, whereby sometime there followeth a wonderful ease. This is imputed vulgarly as if they should draw down the malignity of the disease; but howsoever, this application goeth to the *Head*, and comforteth the *Animal Spirits*.

But these *bloody Baths* and *Unctions* seem to us fluttish and odious: let us search out some others, which perhaps have less loathsomeness in them, and yet no less benefit.

17. Next unto *warm Blood*, things alike in substance to the Body of a man are *nutritives*: fat fleshes of Oxen, swine, Dear; Oysters amongst Fishes; Milk, Butter, Yolks of Eggs, Flower of Wheat, sweet wine, either Sugred, or before it be fined.
18. Such things as we would have mixed to make impression are, instead of all, *Salts*, especially *Bay-salt*; also Wine (when it is full of spirit) maketh entrance, and is an excellent Convoy.
19. *Astringents* of that kind which we described, namely, unctuous and comfortable things, are *Saffron*, *Mastick*, *Myrrhe*, and *Myrtle berries*.
20. Of these parts, in our judgment, may very well be made such a *Bath* as we design: *Physicians* and *Posterity* will find out better things hereafter.
21. But the *Operation* will be much better and more powerful, if such a *Bath* as we have propounded (which we hold to be the principal matter) be attended with a fourfold *Course* and *Order*.
22. First, that there go before the *Bath* a *Frisation* of the body, and an *Anointing* with *Oil*, with some thickning substance, that the virtue and moistning heat of the *Bath* may pierce the body, and not the watry part of the *Liquor*. Then let the *Bath* follow, for the space of some two hours. After the *Bath*, let the body be *Emplaistered* with *Mastick*, *Myrrhe*, *Tragacanth*, *Diapalma*, and *Saffron*; that the perspiration of the body may (as much as is possible) be inhibited, till the *supple matter* be by degrees turned into *solid*: This to be continued for the space of twenty four hours or more. Lastly, the *Emplaistering* being removed, let there be an *anointing* with *Oil* mixed with *salt* and *Saffron*. And let this *Bath*, together with the *Emplaistering* and *Unction*, (as before) be renewed every fifth day. This *Malaciffation* or *suppling* of the body be continued for one whole month.
23. Also during the time of this *Malaciffation*, we hold it useful and proper, and according to our intention, that men nourish their bodies well, and keep out of the cold air, and drink nothing but warm drink.
24. Now this is one of those things (as we warned in general in the beginning) whereof we have made no trial by *Experiment*, but onely set it down out of our aiming and levelling at the end: For having set up the *Mark*, we deliver the *Light* to others.
25. Neither ought the *warmths* and *cherishings* of *living bodies* to be neglected. *Ficinus* saith, and that seriously enough, *That the laying of the young Maid in David's bosom was wholesome for him, but it came too late*. He should also have added, *That the young Maid*, after the manner of the *Persian Virgins*, ought to have been anointed with *Myrrhe*, and such like, not for deliciousness, but to increase the virtue of this cherishing by a living body.
26. *Earbarossa*, in his extream old age, by the advice of a *Physician*, a *Jew*, did continually apply young *Boys* to his stomach and belly, for warmth and cherishing: also some old men lay *Whelps* (creatures of the hottest kind) close to their stomachs every night.
27. There hath gone a report, almost undoubted, and that under several names, of certain men that had great *Noses*, who being weary of the derision of people, have cut off the bunches or hillocks of their *Noses*, and then making a wide gash in their arms, have held their *Noses* in the place for a certain time, and so brought forth fair and comely *Noses*: Which if it be true, it shews plainly the *consent* of *flesh* unto *flesh*, especially in *live fleshes*.
28. Touching the particular *Inteneration* of the principal *Bowels*, the *Stomach*, *Lungs*, *Liver*, *Heart*, *Brain*, *Marrow* of the *Back-bone*, *Guts*, *Reins*, *Gall*, *Veins*, *Arteries*, *Nerves*, *Cartilages*, *Bones*, the *Inquisition* and *Direction* would be too long seeing we now set not forth a *Practick*, but certain *Indications* to the *Practick*.

The Operation upon the Purging away of old Juice, and Supplying of new Juice; or of Renovation by Turns. 10.

The History.

Although those things which we shall here set down have been, for the most part, spoken of before; yet because this Operation is one of the principal, we will handle them over again more at large.

It is certain that *Draught-Oxen* which have been worn out with working, being put into fresh and rich pastures, will gather tender and young flesh again: and this will appear even to the taste and palat; so that the *Inteneration* of flesh is no hard matter. Now it is likely that this *Inteneration* of the *flesh* being often repeated, will in time reach to the *Inteneration* of the *Bones* and *Membranes*, and like *parts* of the *body*.

It is certain that Diets which are now much in use, principally of *Guaiacum*, and of *Sarsaperilla*, *China*, and *Sassafras*, if they be continued for any time, and according to strict rules, do first *attenuate* the whole *juice* of the *body*, and after consume it and drink it up. Which is most manifest, because that by these Diets the *French-Pox*, when it is grown even to an hardness, and hath eaten up and corrupted the very marrow of the *body*, may be effectually cured. And further, because it is manifest that men who by these diets are brought to be extream lean, pale, and as it were ghosts, will soon after become fat, well-coloured, and apparently young again. Wherefore we are absolutely of opinion, that such kind of diets in the decline of age, being used every year, would be very useful to our Intention; like the old skin or spoil of *Serpents*.

We do confidently affirm, (neither let any man reckon us among those *Hereticks* which were called *Cathari*) that often *Purges*, and made even familiar to the *body*, are more available to long life than *Exercises* and *Sweats*: and this must needs be so, if that be held, which is already laid for a ground, That *Unctions* of the *body*, and *Oppletion* of the passages from without, and *Exclusion* of air, and *Detaining* of the *spirit* within the *ma's* of the *body*, do much conduce to long life. For it is most certain, that by *Sweats* and outward *Perspirations* not only the *Humours* and excrementitious vapours are exhaled and consumed, but together with them the *juices* also and good *spirits*, which are not so easily repaired: but in *Purges* (unless they be very immoderate) it is not so, seeing they work principally upon the *Humors*. But the best *Purges* for this Intention are those which are taken immediately before meat, because they dry the *body* less; and therefore they must be of those *Purgers* which do least trouble the *belly*.

These Intentions of the Operations which we have propounded (as we conceive) are most true, the Remedies faithful to the Intentions. Neither is it credible to be told (although not a few of these Remedies may seem but vulgar) with what care and choice they have been examined by us, that they might be (the Intention not at all impeached) both safe and effectual. Experience, no doubt, will both verifie and promote these matters. And such, in all things, are the works of every prudent counsel, that they are Admirable in their Effects, Excellent also in their Order, but seeming Vulgar in the Way and Means.

The Porches of Death.

WE are now to enquire touching the Porches of Death, that is, touching those things which happen unto men at the point of Death, both a little before and after; that seeing there are many Paths which lead to Death, it may be understood in what Common

way they all end, especially in those Deaths which are caused by Indigence of Nature rather than by Violence: although something of this latter also must be inserted, because of the connexion of things.

The History.

1. **T**He living Spirit stands in need of three things that it may subsist; *Convenient Motion, Temperate Refrigeration, and Fit Aliment.* Flame seems to stand in need but of two of these, namely, *Motion* and *Aliment*, because Flame is a simple substance, the Spirit a compounded, insomuch that if it approach somewhat too near to a flamy nature, it overthroweth it self.
2. Also Flame, by a greater and stronger Flame is extinguished and slain, as *Aristotle* well noted, much more the *Spirit*.
3. Flame, if it be much compressed and streightned, is extinguished: as we may see in a Candle having a Glass cast over it; for the Air being dilated by the heat, doth con-
trude and thrust together the Flame, and so lesseneth it, and in the end extinguisheth it; and fires on hearths will not flame if the fuel be thrust close together without any space for the flame to break forth.
4. Also things fired are extinguished with compression; as if you press a burning coal hard with the Tongs or the foot, it is streight extinguished.
5. But to come to the Spirit: if Bloud or Phlegm get into the Ventracles of the Brain, it causeth sudden death, because the Spirit hath no room to move it self.
6. Also a great blow on the head induceth sudden death, the Spirits being streightned within the Ventracles of the Brain.
7. *Opium* and other strong *Stupefactive*s do coagulate the Spirit, and deprive it of the motion.
8. A *venemous Vapour*, totally abhorred by the spirit, causeth sudden death: as in deadly poisons, which work (as they call it) by a specifical malignity; for they strike a loathing into the Spirit, that the spirit will no more move it self, nor rise against a thing so much detested.
9. Also extreme Drunkenness or extreme Feeding sometime cause sudden death, seeing the spirit is not onely oppressed with over-much *condensing*, or the malignity of the vapour, (as in *Opium* and malignant poisons) but also with the abundance of the Vapours.
10. Extreme Grief or Fear, especially if they be sudden, (as it is in a sad and unexpected message) cause sudden death.
11. Not onely over-much Compression, but also over-much Dilatation of the spirit, is deadly.
12. Joys excessive and sudden have bereft many of their lives.
13. In greater Evacuations, as when they cut men for the *Dropsie*, the waters flow forth abundantly; much more in great and sudden fluxes of bloud oftentimes present death followeth: and this happens by the mere flight of *Vacuum* within the body, all the parts moving to fill the empty places, and amongst the rest the spirits themselves. For as for slow fluxes of blood, this matter pertains to the indigence of nourishment, not to the diffusion of the spirits. And touching the motion of the spirit so far, either compressed or diffused, that it bringeth death, thus much.
14. We must come next to the want of Refrigeration. Stopping of the breath causeth sudden death, as in all suffocation or strangling. Now it seems this matter is not so much to be referred to the impediment of Motion, as to the impediment of Refrigeration; for air over-hot, though attracted freely, doth no less suffocate than if breathing were hindred; as it is in them who have been sometime suffocated with burning coals, or with char-coal, or with walls newly plaistered-in close chambers where a fire is made: which kind of death is reported to have been the end of the Emperor *Jovinian*. The like happeneth from dry Baths over heated, which was practised in the killing of *Fausta*, wife to *Constantine* the Great.
15. It is a very small time which Nature taketh to repeat the breathing, and in which

which she desireth to expel the foggy air drawn into the *Lungs*, and to take in new, scarce the third part of a minute.

Again, the beating of the *Pulse*, and the motion of the *Systole* and *Diastole* of the heart, are three times quicker than that of breathing: insomuch that if it were possible that that motion of the heart could be stopped without stopping the breath, death would follow more speedily thereupon than by strangling.

Notwithstanding, use and custom prevail much in this natural action of breathing; as it is in the *Delian Divers* and *Fishers* for Pearl, who by long use can hold their breaths at least ten times longer than other men can do.

Amongst living *Creatures*, even of those that have *Lungs*, there are some that are able to hold their breaths a long time, and others that cannot hold them so long, according as they need more or less refrigeration.

Fishes need less refrigeration than *Terrestrial Creatures*, yet some they need, and take it by their *Gills*. And as *Terrestrial Creatures* cannot bear the air that is too hot or too close; so *Fishes* are suffocated in waters if they be totally and long frozen.

If the *Spirit* be assaulted by another *heat* greater than it self, it is dissipated and destroyed; for it cannot bear the proper *heat* without refrigeration, much less can it bear another heat which is far stronger. This is to be seen in *burning-Fevers*, where the heat of the putrefied humours doth exceed the native heat, even to extinction or dissipation.

The want also and use of *Sleep* is referred to *Refrigeration*. For Motion doth attenuate and rarifie the *Spirit*, and doth sharpen and increase the heat thereof; contrarily, *sleep* setleth and restraineth the motion and gadding of the same: for though *sleep* doth strengthen and advance the actions of the parts and of the liveless spirits, and all that motion which is to the circumference of the body; yet it doth in great part quiet and still the proper motion of the *living Spirit*. Now *sleep* regularly is due unto humane nature once within four and twenty hours, and that for six or five hours at the least: though there are, even in this kind, sometimes miracles of Nature; as it is recorded of *Mecanas*, that he slept not for a long time before his death. And as touching the want of *Refrigeration* for conserving of the *Spirit* thus much.

As concerning the third *Indigence*, namely of *Aliment*, it seems to pertain rather to the parts than to the *living Spirit*; for a man may easily believe that the *living Spirit* subsisteth in Identity, not by succession or renovation. And as for the *reasonable Soul* in man, it is above all question that it is not engendred of the *Soul* of the Parents, nor is repaired, nor can die. They speak of the *Natural spirit* of living *Creatures*, and also of *Vegetables*, which differs from that other *Soul* essentially and formally. For out of the confusion of these that same transmigration of *Souls*, and innumerable other devices of *Heathens* and *Hereticks* have proceeded.

The *Body* of man doth regularly require *Renovation* by *Aliment* every day, and a body in health can scarce endure fasting three days together; notwithstanding use and custome will do much even in this case: but in sickness fasting is less grievous to the body. Also *sleep* doth supply somewhat to nourishment; and on the other side *Exercise* doth require it more abundantly. Likewise there have some been found who sustained themselves (almost to a miracle in nature) a very long time without meat or drink.

Dead Bodies if they be not intercepted by *putrefaction*, will subsist a long time without any notable *Absumption*; but *Living bodies* not above three days, (as we said) unless they be repaired by nourishment: which sheweth that quick *Absumption* to be the work of the *living Spirit*, which either repairs it self, or puts the parts into a necessity of being repaired, or both. This is testified by that also which was noted a little before, namely, that *living creatures* may subsist somewhat the longer without *Aliment* if they sleep: now *sleep* is nothing else but a reception and retirement of the *living Spirit* into it self.

An abundant and continual *effluxion* of blood, which sometimes happeneth in the *Hemorrhoides*, sometimes in vomiting of blood, the inward *Veins* being unlocked or broken, sometimes by wounds, causeth sudden death, in regard that the bloud of the *Veins* ministrech to the *Arteries*, and the bloud of the *Arteries* to the *Spirit*.

18.

19.

20.

21.

22.

23.

24.

25.

26. The quantity of meat and drink which a man, eating two meals a day, receiveth into his body is not small; much more than he voideth again either by stool, or by urine, or by sweating. You will say, No marvel, seeing the remainder goeth into the juices and substance of the body. It is true; but consider then that this addition is made twice a day, and yet the body aboundeth not much. In like manner, though the spirit be repaired, yet it grows not excessively in the quantity.
27. It doth no good to have the Aliment ready, in a degree removed, but to have it of that kind, and so prepared and supplied that the spirit may work upon it: for the staff of a Torch alone will not maintain the flame, unless it be fed with wax, neither can men live upon herbs alone. And from thence comes the *Inconcoction* of old age, that though there be flesh and blood, yet the spirit is become so penurious and thin, and the juices and blood so heartless and obstinate, that they hold no proportion to *Alimentation*.
28. Let us now cast up the *accounts* of the *Needs* and *Indigences*, according to the ordinary and usual course of nature. The Spirit hath need of opening and moving it self in the *Ventricles* of the Brain and Nerves even continually, of the motion of the *Heart* every third part of a moment, of breathing every moment, of sleep and nourishment once within three days, of the power of nourishment commonly till eighty years be past: And if any of these *Indigences* be neglected, *Death* ensueth. So there are plainly three *Porches* of *Death*; *Destitution* of the Spirit in the *Motion*, in the *Refrigeration*, in the *Aliment*.
- It is an error to think that the Living Spirit is perpetually generated and extinguished, as Flame is, and abideth not any notable time: for even Flame it self is not thus out of its own proper nature, but because it liveth amongst enemies, for Flame within Flame endureth. Now the Living Spirit liveth amongst friends, and all due obsequiousness. So then, as Flame is a momentary substance, Air is a fixed substance, the Living Spirit is betwixt both.
- Touching the extinguishing of the Spirit by the destruction of the Organs (which is caused by Diseases and Violence) we enquire not now, as we foretold in the beginning, although that also endeth in the same three *Porches*. And touching the Form of Death it self thus much.
29. There are two great forerunners of Death, the one sent from the *Head*, the other from the *Heart*; *Convulsion*, and the extreme labour of the *Pulse*; for, as for the deadly *Hiccough*, it is a kind of *Convulsion*. But the deadly labour of the *Pulse* hath that unusual swiftness, because the *Heart* at the point of death doth so tremble, that the *Systole* and *Diastole* thereof are almost confounded. There is also conjoined in the *Pulse* a weakness and lowness, and oftentimes a great intermission, because the motion of the *Heart* faileth, and is not able to rise against the assault stoutly or constantly.
30. The immediate proceeding signs of *Death* are, great unquietness and tossing in the bed, fumbling with the hands, catching and grasping hard, gnashing with the teeth, speaking hollow, trembling of the neather lip, paleness of the face, the memory confused, speechless, cold sweats, the body shooting in length, lifting up the white of the eye, changing of the whole visage, (as the nose sharp, eyes hollow, cheeks fallen) contraction and doubling of the coldness in the *extreme parts* of the body; in some, shedding of blood or sperm, shrieking, breathing thick and short, falling of the neather chap, and such like.
31. There follow Death a privation of all sense and motion, as well of the *Heart* and *Arteries* as of the *Nerves* and *Joynts*, an inability of the body to support it self upright, stiffness of the *Nerves* and parts, extream coldness of the whole body; after a little while, putrefaction and stinking.
32. *Eeles*, *serpents* and the *Insecta* will move a long time in every part after they are cut asunder, insomuch that Country people think that the parts strive to joyn together again. Also *Birds* will flutter a great while after their heads are pulled off; and the hearts of living creatures will pant a long time after they are plucked out. I remember I have seen the heart of one that was bowelled, as suffering for High Treason, that being cast into the fire, leaped at the first at least a foot and half in height, and after by degrees lower and lower, for the space, as I remember, of seven or eight minutes. There is also an ancient and credible Tradition of an *Ox* lowing after his bowels were plucked out. But there is a more certain tradition of a man, who being under the

Executioner's hand for high Treason, after his *Heart* was plucked out and in the Executioner's hand, was heard to utter three or four words of prayer : which therefore we said to be more credible than that of the *Ox* in *sacrifice*, because the friends of the party suffering do usually give a reward to the Executioner to dispatch his office with the more speed, that they may the sooner be rid of their pain ; but in *Sacrifices* we see no cause why the Priest should be so speedy in his office.

33.

For *reviving* those again which fall into sudden *Swooning* and *Catalepses* of *astonishments*, (in which Fits many, without present help, would utterly expire) these things are used ; Putting into their mouths Water distilled of Wine, which they call *Hot-waters*, and *Cordial-waters*, bending the body forwards, stopping the mouth and nostrils hard, bending or wringing the fingers, pulling the hairs of the beard or head, rubbing of the parts, especially the face and legs, sudden casting of cold water upon the face, shrieking out aloud and suddenly ; putting *Rose-water* to the nostrills with *Vinegar* in faintings ; burning of Feathers or Cloth in the suffocation of the *Mother* : but especially a *Frying-pan* heated red hot is good in *Apoplexies* ; also a close embracing of the body hath helped some.

34.

There have been many examples of men in shew dead, either laid out upon the cold floor, or carried forth to burial ; nay, of some buried in the earth, which notwithstanding have lived again, which hath been found in those that were buried (the earth being afterwards opened) by the bruising and wounding of their head, through the struggling of the body within the Coffin ; whereof the most recent and memorable example was that of *Joannes scorus*, called the *Subtil*, and a *School-man*, who being digged up again by his Servant, (unfortunately absent at his burial, and who knew his Masters manner in such fits) was found in that state : And the like happened in our days in the person of a Player, buried at *Cambridge*. I remember to have heard of a certain *Gentleman*, that would needs make trial in curiosity what men did feel that were hanged ; so he fastened the Cord about his neck, raising himself upon a stool, and then letting himself fall, thinking it should be in his power to recover the stool at his pleasure, which he failed in, but was helped by a friend then present. He was asked afterward what he felt. He said he felt no pain, but first he thought he saw before his eyes a great fire and burning ; then he thought he saw all black and dark ; lastly it turned to a pale blew, or Sea-water green ; which colour is also often seen by them which fall into *Swoonings*. I have heard also of a Physician, yet living, who recovered a man to life which had hanged himself, and had hanged half an hour, by *Frications* and hot *Baths* : And the same Physician did profess, that he made no doubt to recover any man that had hanged so long, so his Neck were not broken with the first swing.

The Differences of Youth and Old Age.

THe fadder of Man's Body is this, To be conceived, to be quickned in the womb, to be born, to suck, to be weaned, to feed upon Pap, to put forth Teeth the first time about the second year of age, to begin to go, to begin to speak, to put forth Teeth the second time about seven years of age, to come to *Puberty* about twelve or fourteen years of age, to be able for generation and the flowing of the *Menstrua*, to have hairs about the legs and arm-holes, to put forth a Beard ; and thus long, and sometimes later, to grow in stature, to come to full years of strength and agility, to grow gray and bald ; the *Menstruaceasing*, and ability to generation, to grow decrepit and a monster with three legs, to die. Mean-while the Mind also hath certain periods, but they cannot be described by years, as to decay in the *Memory*, and the like ; of which hereafter.

To the 16
Article.

1.

The differences of *Youth* and *old Age* are these : A young man's skin is smooth and plain, an old man's dry and wrinkled, especially about the forehead and eyes ; a young man's flesh is tender and soft, an old man's hard ; a young man hath strength and agility, an old man feels decay in his strength and is slow of motion ; a young man hath

2.

hath good digestion, an old man bad; a young man's bowels are soft and succulent, an old man's salt and parched; a young man's body is erect and streight, an old man's bowing and crooked; a young man's limbs are steady, an old man's weak and trembling; the humours in a young man are cholerick, and his blood inclined to heat, in an old man phlegmatick and melancholick, and his blood inclined to coldness; a young man ready for the act of *Venus*, an old man slow unto it: in a young man the juices of his body are more roscid, in an old man more crude and waterish; the spirit in a young man plentiful and boiling, in an old man scarce and jejune: a young man's spirit is dense and vigorous, an old man's eager and rare; a young man hath his senses quick and intire, an old man dull and decayed; a young man's teeth are strong and entire, an old man's weak, worn, and falln out; a young man's hair is coloured, an old man's (of what colour soever it were) gray; a young man hath hair, an old man baldness; a young man's pulse is stronger and quicker, an old man's more confused and slower; the diseases of young men are more acute and curable, of old men longer and hard to cure; a young man's wounds soon close, an old man's later; a young man's cheeks are of a fresh colour, an old man's pale, or with a black blood; a young man is less troubled with rheums, an old man more. Neither do we know in what things old men do improve as touching their body, save onely sometime in fatness; whereof the reason is soon given, Because old men's bodies do neither perspire well, nor assimilate well: now Fatness is nothing else but an exuberance of nourishment above that which is voided by excrement. or which is perfectly assimilated. Also some old men improve in the appetite of feeding by reason of the *acid humors*, though old men digest worst. And all these things which we have said, *Physicians* negligently enough will refer to the *diminution* of the *Natural heat* and *Radical moisture*, which are things of no worth for use. This is certain. *Driness* in the coming on of years doth forego *Coldness*; and bodies when they come to the top and strength of heat do decline in *Driness*, and after that follows *Coldness*.

3.

Now we are to consider the *Affections* of the *Mind*. I remember when I was a young man, at *Poitiers* in *France* I conversed familiarly with a certain *French man*, a witty young man, but something talkative, who afterwards grew to be a very eminent man: he was wont to inveigh against the manners of *old men*, and would say, That if their Minds could be seen as their Bodies are, they would appear no less deformed. Besides, being in love with his own wit, he would maintain, That the vices of old men's Minds have some correspondence and were parallel to the putrefactions of their Bodies: For the driness of their skin he would bring in *Impudence*; for the hardness of their bowels, *unmercifulness*; for the lippitude of their eyes, an *evil Eye* and *Envy*: for the casting down of their eyes, and bowing their body towards the earth, *Atheism*; (for, saith he, *they look no more up to Heaven as they are wont*) for the trembling of their members, *Irresolution* of their decrees and *light Inconstancy*; for the bending of their fingers, as it were to catch, *Rapacity* and *covetousness*; for the buckling of their knees, *Fearfulness*; for their wrinkles, *Craftiness* and *Obliquity*: and other things which I have forgotten. But to be serious, a young man is modest and shamefac'd; an old man's fore-head is hardned; a young man is full of bounty and mercy, an old man's heart is brawny; a young man is affected with a laudable emulation, an old man with a malignant envy; a young man is inclined to Religion and Devotion, by reason of his fervency and inexperience of evil, an old man coolth in piety through the coldness of his charity, and long conversation in evil, and likewise through the difficulty of his belief; a young man's desires are vehement, an old man's moderate; a young man is light and moveable, an old man more grave and constant; a young man is given to liberality, and beneficence, and humanity, an old man to covetousness, wisdom for his own self, and seeking his own ends; a young man is confident and full of hope, an old man diffident and given to suspect most things; a young man is gentle and obsequious, an old man froward and disdainful; a young man is sincere and open-hearted, an old man cautelous and close; a young man is given to desire great things, an old man to regard things necessary; a young man thinks well of the present times, an old man preferreth times past before them; a young man reverenceth his Superiours, an old man is more forward to tax them: And many other things, which pertain rather to Manners than to the present Inquisition. Notwithstanding old men, as in some things they improve in their Bodies, so also in their Minds, unless they be altogether out of date: namely, that as they are less apt for invention,

tion, so they excel in judgment, and prefer safe things and found things before specious; also they improve in Garrulity and Ostentation, for they seek the fruit of speech, while they are less able for action: So as it was not absurd that the Poets feigned old *Tithon* to be turned into a *Grashopper*.

Moveable Canons of the Duration of Life and Form of Death.

Canon I.

Consumption is not caused, unless that which is departed with by one body passeth into another.

The Explication.

There is in Nature no *Annihilating*, or *Reducing to Nothing*: therefore that which is consumed is either resolved into Air, or turned into some Body adjacent. So we see a *spider*, or *Fly*, or *Ant* in Amber, entombed in a more stately Monument than *Kings* are, to be laid up for Eternity, although they be but tender things, and soon dissipated: But the matter is this, that there is no air by, into which they should be resolved; and the *substance* of the *Amber* is so *heterogeneous*, that it receives nothing of them. The like we conceive would be if a *Stick*, or *Root*, or some such thing were buried in *Quick-silver*: also *Wax*, and *Honey*, and *Gums* have the same *Operation*, but in part onely.

Canon II.

There is in every Tangible body a Spirit, covered and encompassed with the grosser parts of the body, and from it all Consumption and Dissolution hath the beginning.

The Explication.

NO Body known unto us here in the upper part of the Earth is without a Spirit, either by *Attenuation* and *Concoction* from the heat of the Heavenly Bodies, or by some other way: for the *Concavities* of *Tangible things* receive not *Vacuum*, but either Air, or the proper *Spirit* of the thing. And this *Spirit* whereof we speak is not some *Virtue*, or *Energie*, or *Act*, or a *Trifle*, but plainly a *Body*, rare and invisible; notwithstanding circumscribed by Place, Quantitative, Real. Neither again is that Spirit Air, (no more than Wine is Water) but a body rarefied, of kin to Air, though much different from it. Now the grosser parts of bodies (being dull things, and not apt for motion) would last a long time; but the Spirit is that which troubleth, and plucketh, and undermineth them, and converteth the moisture of the body, and whatsoever it is able to digest, into new Spirit; and then as well the pre-existing Spirit of the body as that newly made flie away together by degrees. This is best seen by the *Diminution* of the *weight* in bodies dried through *Perspiration*: for neither all that which is issued forth was Spirit when the body was ponderous, neither was it not Spirit when it issued forth.

Canon III.

The Spirit issuing forth drieth; Detained and working within either Melteth, or Putrefieth, or Vivifieth.

The Explication.

There are four Processes of the Spirit, to *Arefaction*, to *Colliquation*, *Putrefaction*, to *Generation* of bodies. *Arefaction* is not the proper work of the Spirit, but of the grosser parts after the Spirit issued forth: for then they contract themselves partly by their flight of *Vacuum*, partly by the *union* of the *Homogeneous*: as appears in all things which are arced by age, and in the drier sort of bodies which have passed the fire, as *Bricks*, *Star coal*, *Bread*. *colliquation* is the mere work of the Spirit: neither is it done but when they are excited by heat: for when the Spirits dilating themselves, yet not getting forth, do insinuate and disperse themselves among the grosser parts, and so make them soft and apt to run, as it is in *Metalls* and *wax*: for *Metalls* and all tenacious things are apt to inhibit the Spirit, that being

excited it issueth not forth. *Putrefaction* is a mixed work of the *Spirits* and of the grosser parts : for the Spirit (which before restrained and bridled the parts of the thing) being partly issued forth and partly ineebled, all things in the body do dissolve and return to their *Homogeneities*, or (if you will) to their Elements : that which was *Spirit* in it is congregated to it self, whereby things putrefied begin to have an ill favour : the *Oily* parts to themselves, whereby things putrefied have that slipperiness and unctuosity ; the *watry* parts also to themselves : the *Dregs* to themselves : whence followeth that *confusion* in *bodies putrefied*. But *Generation* or *Vivification* is a work also mixed of the Spirit and grosser parts, but in a far different manner : for the Spirit is totally detained, but it swelleth and moveth locally : and the grosser parts are not dissolved, but follow the motion of the spirit, and are, as it were, blown out by it, and extruded into divers figures, from whence cometh that *Generation* and *Organization* : and therefore *Vivification* is always done in a matter tenacious and clammy, and again, yielding and soft, that there may be both a detention of the spirit, and also a gentle cession of the parts, according as the spirit forms them. And this is seen in the matter as well of all Vegetables as of living Creatures, whether they be engendred of Putrefaction or of Sperm ; for in all these things there is manifestly seen a matter hard to break through, easie to yield.

Canon IV.

*I*N all living Creatures there are two kinds of Spirits : Liveless Spirits, such as are in bodies Inanimate ; and a Vital Spirit superadded.

The Explication.

*I*T was said before, that to procure long life the Body of man must be considered, first, as *Inanimate*, and not repaired by nourishment : secondly, as *Animate*, and repaired by nourishment : for the former consideration gives Laws touching *Consumption*, the latter touching *Reparation*. Therefore we must know that there are in humane flesh bones, Membranes, Organs : finally, in all the parts such spirits diffused in the substance of them while they are alive, as there are in the same things (Flesh, Bones, Membranes, and the rest) separated and dead : such as also remain in a *Carcase* : but the *Vital Spirit*, although it ruleth them, and hath some consent with them, yet it is far differing from them, being integral, and subsisting by it self. Now there are two special differences betwixt the *Liveless Spirits* and the *Vital Spirits*. The one, that the *Liveless spirits* are not continued to themselves, but are, as it were, cut off, and encompassed with a gross body which intercepts them ; as *Air* is mixed with *snow* or *Froth* : but the *Vital Spirit* is all continued to it self by certain Conduit-pipes through which it passeth, and is not totally intercepted. And this Spirit is two-fold also : the one branched, onely passing through small pipes, and, as it were, strings : the other hath a *Cell* also, so as it is not onely continued to it self, but also congregated in an hollow space in reasonable good quantity, according to the Analogy of the body, and in that *Cell* is the fountain of the Rivulets which branch from thence. That *Cell* is chiefly in the Ventricles of the Brain, which in the ignobler sort of creatures are but narrow, infomuch that the spirits in them seem scattered over their whole body rather than Celled ; as may be seen in *Serpents*, *Eels* and *Flies*, whereof every of their parts move long after they are cut assunder. *Birds* also leap a good while after their heads are pulled off, because they have little heads and little Cells. But the nobler sort of creatures have those Ventricles larger, and Man the largest of all. The other difference betwixt the Spirits is, that the *Vital Spirit* hath a kind of enkindling, and is like a Wind or Breath compounded of Flame and Air, as the Juices of living creatures have both *Oil* and *water*. And this enkindling ministreth peculiar motions and faculties : for the smoke which is inflamable, even before the flame conceived, is hot, thin and movable, and yet it is quite another thing after it is become flame : but the enkindling of the vital spirits is by many degrees gentler than the softest flame, as of *Spirit of Wine*, or otherwise ; and besides, it is in great part mixed with an *Aerial* substance, that it should be a *Mystery* or *Miracle*, both of a *Flammeous* and *Aereous* nature.

Canon V.

*T*He Natural Actions are proper to the severall Parts, but it is the Vital Spirit that excites and sharpens them.

The Explication.

THe Actions or Functions which are in the several Members follow the nature of the Members themselves, (*Attraction, Retention, Digestion, Assimilation, Separation, Excretion, Perspiration, even Sense it self*) according to the propriety of the several Organs, (*the Stomach, Liver, Heart, Spleen, Gall, Brain, Eye, Ear, and the rest*;) yet none of these Actions would ever have been actuated but by the vigour and presence of the *Vital Spirit* and heat thereof: as one *Iron* would not have drawn another *Iron*, unless it had been excited by the *Load Stone*, nor an *Eggs* would ever have brought forth a *Bird*, unless the substance of the *Hen* had been actuated by the treading of the *Cock*.

Canon VI.

THe liveless Spirits are next Consubstantial to Air; the vital Spirits approach more to the Substance of Flame.

The Explication.

THe Explication of the precedent fourth Canon is also a declaration of this present Canon: but yet further, from hence it is that all fat and oily things continue long in their Being; For neither doth the *Air* much pluck them, neither do they much desire to joyn themselves with *Air*. As for that conceit it is altogether vain, That *Flame* should be *Air* set on fire, seeing *Flame* and *Air* are no less heterogeneous than *oil* and *water*. But whereas it is said in the Canon, that the *vital spirits* approach more to the substance of *Flame*; it must be understood, that they do this more than the *liveless spirits*, not that they are more *Flamy* than *Airy*.

Canon VII.

The Spirit hath two Desires; one of multiplying it self, the other of flying forth and congregating it self with the Connaturals.

The Explication.

THe Canon is understood of the *liveless spirits*; for as for the *second Desire*, the *vital spirit* doth most of all abhor flying forth of the body, for it finds no *Connatural* here below to joyn withal: Perhaps it may sometimes flie to the outward parts of the body, to meet that which it loveth; but the flying forth, as I said, it abhorreth. But in the *liveless spirits* each of these two *Desires* holdeth. For to the former this belongeth, *Every spirit seated amongst the grosser parts dwelleth unhappily*; and therefore when it finds not a *like* unto it self, it doth so much the more labour to create and make a *like*, as being in a great solitude, and endeavour earnestly to multiply it self, and to prey upon the *volatile* of the *grosser parts*, that it may be increased in quantity. As for the *second Desire* of flying forth, and betaking it self to the *Air*, it is certain that all light things (which are ever movable) do willingly go unto their *likes* near unto them, as a *Drop* of water is carried to a *Drop*, *Flame* to *Flame*: but much more this is done in the flying forth of *spirit* into the *Air* ambient, because it is not carried to a particle like unto it self, but also as unto the *Globe* of the *connaturals*. Mean-while this is to be noted, That the *going forth* and *flight* of the *spirit* into *air* is a redoubled action, partly out of the *appetite* of the *spirit*, partly out of the *appetite* of the *air*; for the *common air* is a needy thing, and receiveth all things speedily, as *Spirits, Odours, Beams, sounds*, and the like.

Canon VIII.

Spirit detained, if it have no possibility of begetting new spirits, itenerateth the grosser parts.

The Explication.

Generation of new Spirit is not accomplished but upon those things which are in some degree near to spirit, such as are humid bodies. And therefore if the grosser parts (amongst which the Spirit converseth) be in a remote degree, although the spirit cannot convert them, yet (as much as it can) it weakneth, and softneth, and subdueth them, that seeing it cannot increase in quantity, yet it will dwell more at large, and live amongst good neighbours and friends. Now this *Aphorism* is most useful to our End, because it tendeth to the Inteneration of the obstinate parts by the detention of the spirit.

Canon IX.

THe Inteneration of the harder parts cometh to good effect, when the Spirit neither flyeth forth, nor begetteth new Spirit.

The Explication.

THis *Canon* solveth the knot and difficulty in the Operation of Intenerating by the Detention of the *Spirit*: for if the *Spirit* not flying forth wasteth all within, there is nothing gotten to the *Inteneration* of the parts in their subsistence, but rather they are dissolved and corrupted. Therefore together with the *Detention* the *Spirits* ought to be cooled and restrained, that they may not be too active.

Canon X.

The heat of the Spirit to keep the body fresh and green, ought to be Robust, not Eager.

The Explication.

Also this *Canon* pertaineth to the solving of the knot aforesaid, but it is of a much larger extent, for it setteth down of what *temperament* the *heat* in the body ought to be for the obtaining of Long life. Now this is useful, whether the *Spirits* be detained, or whether they be not. For howsoever the *heat* of the *Spirits* must be such, as it may rather turn it self upon the hard parts than waste the soft; for the one Desiccateth, the other Intenerateth. Besides, the same thing is available to the well perfecting of *Assimilation*; for such an heat doth excellently excite the *faculty* of *Assimilation*, and withall doth excellently prepare the matter to be *Assimilated*. Now the properties of this kind of *heat* ought to be these. First, that it be *slow*, and heat not suddenly: Secondly, that it be not very *intense*, but *moderate*: Thirdly, that it be *equal*, not *incompesed*, namely, intending and remitting it self: Fourthly, that if this heat meet any thing to resist it, it be not easily suffocated or languish. This *Operation* is exceeding subtil, but seeing it is one of the most useful, it is not to be deserted. Now in those *Remedies* which we propounded to invest the *Spirits* with a *Robust heat*, or that which we call *Operative*, not *Predatory*, we have in some sort satisfied this matter.

Canon XI.

The Condensing of the Spirits in their Substance is available to Long life.

The Explication.

THis *Canon* is subordinate to the next precedent: for the *Spirit condensed* receiveth all those four properties of heat whereof we speak; but the ways of *Condensing* them are set down in the first of the *Ten Operations*.

Canon XII.

The Spirit in great quantity hastneth more to flying forth, and preyeth upon the body more, than in small quantity.

The Explication.

THis *Canon* is clear of it self, seeing mere *Quantity* doth regularly increase virtue. And it is to be seen in flames, that the bigger they are, the stronger they break forth, and the more speedily they consume. And therefore over-great *plenty* or *exuberance* of the *Spirits* is altogether hurtful to Long life; neither need one wish a greater store of *Spirits* than what is sufficient for the function of life, and the office of a good *Reparation*.

Canon XIII.

The Spirit equally dispersed maketh less haste to flie forth, and preyeth less upon the body, than unequally placed.

The Explication.

Not onely abundance of *Spirits* in respect of the whole is hurtful to the *Duration* of things, but also the same abundance unevenly placed is in like manner hurtful; and therefore the more the *Spirit* is shred and inserted by small portions, the less it preyeth; for *Dissolution* ever beginneth at that part where the *Spirit* is looser. And therefore both *Exercise* and *Frications* conduce much to long life, for *Agitation* doth finest diffuse and commix things by small portions.

Canon XIV.

The inordinate and subfultory motion of the Spirits doth more hasten to going forth, and doth prey upon the body more, than the constant and equal.

The Explication.

IN *Inanimates* this *Canon* holds for certain; for *Inequality* is the Mother of *Dissolution*: but in *Animates* (because not onely the *Consumption* is considered, but the *Repara-*

Reparation, and Reparation proceedeth by the Appetites of things, and Appetite is sharpened by variety) it holdeth not rigorously; but it is so far forth to be received, that this variety be rather an alternation or entercchange than a confusion, and as it were constant in inconstancy.

Canon XV.

The Spirit in a Body of a solid compofure is detained, though unwillingly.

The Explication.

ALl things do abhor a *Solution* of their *Continuity*, but yet in proportion to their *Density* or *Rarity*: for the more *rare* the *bodies* be, the more do they suffer themselves to be thrust into small and narrow passages; for *water* will go into a passage which *dust* will not go into, and *air* which *water* will not go into, nay, *flame* and *spirit* which *air* will not go into. Notwithstanding of this thing there are some bounds: for the *spirit* is not so much transported with the desire of going forth, that it will suffer it self to be too much discontinued, or be driven into over-streight pores and passages; and therefore if the *spirit* be encompassed with an *hard* body, or else with an *unctuous* and *tenacious*, (which is not easily divided) it is plainly bound, and, as I may say, imprisoned, and layeth down the appetite of going out: wherefore we see that *Metalls* and *stones* require a longtime for their *spirit* to go forth, unless either the *spirit* be excited by the fire, or the grosser parts be dissevered with corroding and strong waters. The like reason is there of *tenacious bodies*, such as are *Gums*, save onely that they are melted by a more gentle heat: and therefore the *juices* of the body *hard*, a *close* and *compact skin*, and the like, (which are procured by the *driness* of the *Aliment*, and by *Exercise*, and by the *coldness* of the *air*) are good for long life, because they detain the *spirit* in close prison that it goeth not forth.

Canon XVI.

In Oily and Fat things the Spirit is detained willingly, though they be not tenacious.

The Explication.

THe *spirit*, if it be not irritated by the *antipathy* of the body enclosing it, nor fed by the over-much *likeness* of that body, nor sollicitated nor invited by the *external body*, it makes no great stir to get out: all which are wanting to *Oily bodies*; for they are neither so pressing upon the *spirits* as *hard bodies*, nor so near as *watry bodies*, neither have they any good agreement with the *air ambient*.

Canon XVII.

The speedy flying forth of the Watry humor conserves the Oily the longer in his being.

The Explication.

WE said before that the *Watry humors*, as being consubstantial to the *Air*, flie forth soonest; the *Oily* later, as having small agreement with the *Air*. Now whereas these two *humors* are in most bodies, it comes to pass that the *watry* doth in a sort betray the *Oily*, for that issuing forth insensibly carrieth this together with it. Therefore there is nothing more furthereth the conservation of bodies than a *gentle drying* of them, which causeth the *watry humor* to expire, and inviteth not the *Oily*; for then the *Oily* enjoyeth the proper nature. And this tendeth not onely to the inhibiting of *Putrefaction*, (though that also followeth) but to the conservation of *Greenness*. Hence it is, that *gentle Frictions* and *moderate Exercises*, causing rather *Perspiration* than *Sweating*, conduce much to long life.

Canon XVIII.

Air excluded conserreth to Long life, if other inconveniences be avoided.

The Explication.

WE said a little before, that the *flying forth* of the *spirit* is a redoubled action, from the *appetite* of the *spirit* and of the *air*, and therefore if either of these be taken out of the way, there is not a little gained. Notwithstanding divers *Inconveniences* follow hereupon, which how they may be prevented we have shewed in the second of our *Operations*.

Canon XIX.

Youthful spirits inserted into an old Body might soon turn Nature's course back again.

The Explication.

THE nature of the *spirits* is as the uppermost wheel, which turneth about the other wheels in the body of man, and therefore in the *Intention* of Long life, that ought to be first placed. Hereunto may be added, that there is an easier and more expedite way to alter the *spirits*, than to other *Operations*. For the *Operation* upon the *spirits* is two-fold: the one by *Aliments*, which is slow, and, as it were, about; the other, (and that two fold) which is sudden, and goeth directly to the *spirits*, namely, by *Vapours*, or by the *Affections*.

Canon XX.

Juices of the Body hard and roscid are good for Long life.

The Explication.

THE reason is plain, seeing we shewed before, that *hard* things, and *oily* or *roscid* are hardly dissipated: notwithstanding there is difference, (as we also noted in the tenth *Operation*) That *juice* somewhat *hard* is indeed less *dissipable*, but then it is withal less *reparable*: therefore a *convenience* is interlaced with an *Inconvenience*, and for this cause no wonderful matter will be atchieved by this. But *roscid* *juice* will admit both *operations*; therefore this would be principally endeavoured.

Canon XXI.

Whatsoever is of thin parts to penetrate, and yet hath no Acrimony to bite, begetteth Roscid Juices.

The Explication.

THIS *Canon* is more hard to practise than to understand. For it is manifest, whatsoever *penetrateth* well, but yet with a *sting* or *tooth*, (as do all sharp and four things) it leaveth behind it wheresoever it goeth some mark or print of *driness* and *cleaving*, so that it hardneth the *juices*, and chappeth the *parts*: contrarily, whatsoever things *penetrate* through their *shinness* merely, as it were by stealth, and by way of insinuation, without violence, they *bedew* and *water* in their passage. Of which sort we have recounted many in the fourth and seventh *Operations*.

Canon XXII.

Affimilation is best done when all Local Motion is expended.

The Explication.

THIS *Canon* we have sufficiently explained in our Discourse upon the eighth *Operation*.

Canon XXIII.

Alimentation from without, as least some other way than by the Stomach, is most profitable for Long life, if it can be done.

The Explication.

WE see that all things which are done by *Nutrition*, ask a long time, but those which are done by *embracing* of the *like* (as it is in *Infusions*) require no long time. And therefore *Alimentation* from without would be of principal use, and so much the more, because the *Faculties* of *Concoction* decay in old age: so that if there could be some auxiliary *Nutritions*, by *Bathings*, *Unctions*, or else by *Clysters*, these things in conjunction might do much, which single are less available.

Canon XXIV.

Where the Concoction is weak to thrust forth the Aliment, there the Outward parts should be strengthened to call forth the Aliment.

The Explication.

THAT which is propounded in this *Canon* is not the same thing with the former; for it is one thing for the *outward Aliment* to be attracted *inward*, another for the *inward Aliment* to be attracted *outward*: yet herein they concur, that they both help the weakness of the *inward Concoctions*, though by divers ways.

Canon XXV.

ALL sudden Renovation of the Body is wrought either by the Spirit, or by Malaciffations.

The Explication.

HERE are two things in the body, *Spirits* and *Parts*: to both these the way by *Nutrition* is long and about; but it is a short way to the *Spirits* by *Vapours* and by the *Affections*, and to the *Parts* by *Malaciffations*. But this is diligently to be noted, that by no means we confound *Alimentation from without* with *Malaciffation*; for the intention of *malaciffation* is not to nourish the parts, but onely to make them more fit to be nourished.

Canon

Canon XXVI.

Malaciffation is wrought by *Consubstantials*, by *Imprinters*, and by *Clofers* up.

The Explication.

THe reason is manifest, for that *Consubstantials* do properly fupple the body, *Imprinters* do carry in, *Clofers* up do retain and bridle the *Perspiration*, which is a motion oppofite to *Malaciffation*. And therefore (as we described in the ninth *operation*) *Malaciffation* cannot well be done at once, but in a courfe or order. Firft, by excluding the *Liquor* by *Thickners*: for an outward and grofs Infufion doth not well compact the body: that which entreteth muft be fubtil, and a kind of vapour. Secondly, by *Intenerating* by the confent of *Consubstantials*: for bodies upon the touch of thofe things which have good agreement with them, open themfelves, and relax their pores. Thirdly, *Imprinters* are *Convoys*, and infinuate into the parts the *Consubstantials*, and the mixture of gentle *Astringents* doth fomewhat reftrein the *Perspiration*. But then, in the fourth place, follows that great *Aftriction* and *Clofure* up of the body by *Emplaiftration*, and then afterward by *Inunction*, until the *Supple* be turned into *Solid*, as we faid in the proper place.

Canon XXVII.

Frequent Renovation of the Parts Repairable *watereth* and *reneweth* the *left* Repairable alfo.

The Explication.

WE faid in the Preface to this *History*, that the *way* of *Death* was this, That the *Parts Repairable* died in the fellowfhip of the *Parts left Repairable*: fo that in the *Reparation* of thefe fame *left Repairable Parts* all our forces would be employed. And therefore being admonifhed by *Aristotle's* obfervation touching *Plants*, namely, *That the putting forth of new fhoots and branches refrefheth the body of the Tree in the paffage*; we conceive the like reafon might be, if the *flefh* and *bloud* in the body of man were often renewed, that thereby the *bones* themfelves, and *membranes*, and other parts which in their own nature are *left Repairable*, partly by the chearful paffage of the *juices*, partly by that new cloathing of the young *flefh* and *bloud*, might be *watered* and *renewed*.

Canon XXVIII.

Refrigeration or *Cooling* of the body, which paffeth fome other ways than by the *Stomach*, is *ufeful* for *Long life*.

The Explication.

THe reafon is at hand: for feeing a *Refrigeration* not temperate, but powerful, (efpecially of the *bloud*) is above all things neceffary to *Long life*: this can by no means be effected from within as much as is requifite, without the *destruction* of the *Stomach* and *Bowels*.

Canon XXIX.

That *Intermixing* or *Intangling*, that as well *Consumption* as *Reparation* are the *works* of *Heat*, is the *greateft* obftacle to *Long life*.

The Explication.

Almoft all great works are *destroyed* by the *Natures* of things *Intermixed*, whenas that which helpeth in one refpect hurteth in another: therefore men muft proceed herein by a found judgement, and a difcreet practice. For our part, we have done fo as far as the matter will bear, and our memory ferveth us, by *feperating benign heats* from *hurtful*, and the *Remedies* which tend to both.

Canon XXX.

Curing of *Difeafes* is effected by *Temporary Medicines*; but *Lengthning* of *Life* requireth *Obfervation* of *Diets*.

The Explication.

Thofe things which come by accident, as foon as the caufes are removed ceafe again; but the continued courfe of nature, like a running *River*, requires a continual rowing and failing againft the *ftream*: therefore we muft work regularly by *Diets*. Now *Diets* are of two kinds: *Set Diets*, which are to be obferved at certain times; and *Familiar Diet*, which is to be admitted into our daily repaft. But the *Set Diets* are the more potent, that is, a courfe of *Medicines* for a time: for thofe things which are of fo great virtue that they are able to turn *Nature* back again, are, for the moft part, more ftrong, and more fpeedily altering, than thofe which may without danger be received into a continual ufe. Now in the *Remedies* fet down in our *Intentions* you fhall

shall find onely three *Set Diets*, the *Opiate Diet*, the *Diet Malacissant* or *Suppling*, and the *Diet Emaciant* and *Renewing*. But amongst those which we prescribed for *Familiar Diet*, and to be used daily, the most efficacious are these that follow, which also come not far short of the vertue of *Set Diets*: *Nitre* and the *subordinates* to *Nitre*; the *Regiment* of the *Affections* and *Course* of our *Life*; *Refrigeratours* which pass not by the *Stomach*; *Drinks Roscidating*, or *ingendring Oily Juices*; besprinkling of the blood with some *firmer Matter*, as *Pearls*, certain *woods*, competent *Unctions* to keep out the *Air*, and to keep in the *Spirit*; *Heaters* from without, during the *Assimilation* after sleep; avoiding of those things which inflame the *Spirit*, and put it into an *eager heat*, as *wine* and *spices*; lastly, a moderate and seasonable use of those things which endue the *Spirits* with a *robust Heat*, as *Saffron*, *Crosses*, *Garlick*, *Elecampane*, and *compound Opiates*.

Canon XXXI.

The Living Spirit is instantly extinguished if it be deprived either of Motion, or of Refrigeration, or of Aliment.

The Explication.

NAmely, these are those three which before we called the *Porches* of *Death*, and they are the proper and immediate passions of the *Spirit*. For all the *Organs* of the principal parts serve hereunto, that these three *Offices* be performed; and again, all destruction of the *Organs* which is deadly brings the matter to this point, that one or more of these three fail. Therefore all other things are the divers ways to *Death*, but they end in these three. Now the *whole Fabrick* of the *Parts* is the *Organ* of the *Spirit*, as the *spirit* is the *Organ* of the *Reasonable Soul*, which is *incorporeous* and *Divine*.

Canon XXXII.

Flame is a Momentary Substance, Air a Fixed; the Living Spirit in Creatures is of a middle Nature.

The Explication.

THIS matter stands in need both of an higher Indagation and of a longer Explication than is pertinent to the present Inquisition. Mean-while we must know this, that *Flame* is almost every moment generated and extinguished; so that it is continued only by succession: but *Air* is a *fixed body*, and is not dissolved; for though *Air* begets new *Air* out of watery moisture, yet notwithstanding the old *Air* still remains; whence cometh that Super-oration of the *Air* whereof we have spoken in the Title *De Ventis*. But *Spirit* is participant of both Natures, both of *Flame* and *Air*, even as the nourishments thereof are, as well *Oil*, which is homogeneous to *Flame*; as *Water*, which is homogeneous to *Air*: for the *Spirit* is not nourished either of *Oily* alone, or of *watry* alone, but of both together; and though *Air* doth not agree well with *Flame*, nor *Oil* with *water*, yet in a *mix'd body* they agree well enough. Also the *Spirit* hath from the *Air* his easie and delicate impressions and yieldings, and from the *Flame* his noble and potent motions and activities. In like manner the *Duration* of *spirit* is a *mixed thing*, being neither so *momentary* as that of *Flame*, nor so *fixed* as that of *Air*: And so much the rather it followeth not the condition of *Flame*, for that *Flame* it self is extinguished by accident, namely, by *Contraries* and *Enemies* environing it; but *spirit* is not subject to the like conditions and necessities. Now the *Spirit* is repaired from the lively and florid blood of the small *Arteries* which are inserted into the *Brain*; but this Reparation is done by a peculiar manner, of which we speak not now.

ARTICLES
OF
ENQUIRY,
TOUCHING
METALS & MINERALS.

The first Letter of the Alphabet is, the Compounding, Incorporating, or Union, of Metals or Minerals.

With what Metals, Gold will incorporate, by Simple Colliquefactions, and with what not? And in what quantity it will incorporate? and what kinde of Body the Compound makes?

Gold with Silver, which was the ancient *Electrum*.

Gold with Quick-silver.

Gold with Lead.

Gold with Copper.

Gold with Brass.

Gold with Iron.

Gold with Tin.

So likewise of Silver.

Silver with Quick-silver.

Silver with Lead.

Silver with Copper.

Silver with Brass.

Silver with Iron.

Silver with Tin.

So likewise of Quick-silver.

Quick-silver with Lead.

Quick-silver with Copper.

Quick-silver with Brass.

Quick-silver with Iron.

Quick-silver with Tin.

So of Lead.

Lead with Copper.

Lead with Brass.

Lead with Iron.

Lead with Tin.

So of Copper.

Copper with Brass.

Copper with Iron.

Copper with Tin.

So of Brass.

Brass with Iron.

Brass with Tin.

So of Iron.

Iron with Tin.

What are the Compound Metals, which are common, and known? And what are the Proportions of their mixtures? As

Lattin of Brass, and the Calaminar-stone.

Bell-metal of, &c.

The counterfeit Plate, which they call Alchumy.

The Decomposites of three Metals, or more, are too long to enquire, except there be some Compositions of them already observed.

It is also to be observed, Whether any two Metals which will not mingle of themselves, will mingle with the help of another; and what?

What Compounds will be made of Metal, with Stone, and other Fossiles? As Lattin is made with Brass, and the Calaminar-stone. As all the Metals with Vitriol: All with Iron powdered. All with Flint, &c.

Some few of these would be enquired of, to disclose the Nature of the rest.

WHether Metals, or other Fossiles, will incorporate with Molten Glas? And what Body it makes?

The quantity in the mixture would we well considered: For some small quantity, perhaps, would incorporate; as in the Allays of Gold, and Silver Coyn.

Upon the Compound Body, three things are chiefly to be observed. The Colour, the Fragility or Pliantness, the Volatility or Faxation, compared with the Simple Bodies.

For present use or profit, this is the Rule. Consider the price of the two Simple Bodies; consider again the Dignity of the one above the other

other, in use. Then see, if you can make a compound that will save more in the price, then it will lose in the dignity of the use. As for example, Consider the price of Brass Ordnance; consider again the price of Iron Ordnance; and consider, wherein the Brass Ordnance doth excel the Iron Ordnance in use. Then if you can make a Compound of Brass and Iron Ordnance, that will be near as good in use, and much cheaper in price, there is profit both to the private and to the Commonwealth.

So of Gold and Silver, the price is double of Twelve. The dignity of Gold above Silver is not much; the splendor is alike, and more pleasing to some eye, As in Cloth of Silver; Silver Lace, silvered Rapiers, &c. The main dignity is, that Gold bears the Fire, which Silver doth not; but that is an excellency in Nature, but it is nothing at all in use. For any dignity in use, I know none, but that Silvering will fuly and canker more then Gilding; which, if it may be corrected, with a little mixture of Gold, there is profit: And I do somewhat marvel, that the later ages have lost the ancient *Flectrum*, which was a mixture of Silver with Gold; whereof, I conceive, there may be much use both in Coyn, Plate, and Gilding.

It is to be noted, that there is in the Version of Metals, impossibility, or at least great difficulty; as in making of Gold, Silver, Copper: On the other side, in the adulterating or counterfeiting of Metals there is deceit and villainy; but it should seem there is a middle way, and that is, by new compounds, if the ways of incorporating were well known.

What Incorporation or Imbibition, Metals will receive from Vegetables, without being dissolved might be inquired. As when the Armorers make their Steel more tough and plyant, by the asperion of Water, or Juyce of Herbs: When Gold being grown somewhat churlish by recovering, is made more plyant by throwing in shreds of Tanned Leather, or by Leather oyled.

Note, that in these, and the like shews of Imbibition, it were good to try by the weight, whether the weight be increased, or no? For if it be not, it is to be doubted, that there is no Imbibition of Substance; but onely, that the Application of the other Body, doth dispose and invite the Metal to another posture of parts then of it self, it would have taken.

After the Incorporation of Metals, by simple Colliquefaction, for the better discovery of the Nature: And Consents and Dissents of Metals by incorporating of their Dissolutions, it would be enquired.

What Metals being dissolved by Strong-waters, will incorporate well together, and what not? which is to be inquired particularly, as it was in Colliquefactions.

There is to be observed in those Dissolutions, which will not incorporate what the effects are: As the Ebullition, the Precipitation to the bottom, the Ejaculation towards the top, the Suspension in the midst, and the like.

Note, that the Dissents of the Menstrua, or Strong-waters, may hinder the Incorporation, as well as the Dissents of the Metals themselves: Therefore where the Menstrua are the same, and yet the Incorporation followeth not, you may conclude, the Dissent is in the Metals, but where the Menstrua are several, not so certain.

THe Second Letter of the Cross Row, is the Separation of Metals, and Minerals. Separation is of three sorts; the first is, The separating of the pure Metal from the Ure or Dross, which we call Refining. The second is, The drawing one Metal or Mineral out of another, which we may call Extracting. The third, The separating of any Metal into his Original or Elements, or call them what you will) which work we call Precipitation.

For Refining, we are to enquire of it according to the several Metals; As Gold, Silver, &c. Incidentally, we are to enquire of the first Stone, or Ure, or Spar, or Marcasite of Metals severally; and what kinde of Bodies they are; and of the degrees of Richness.

Also, we are to enquire of the Means of separating, whether by Fire, parting Waters, or otherwise.

Also, for the manner of Refining, you are to see how you can multiply the Heat, or hasten the Opening; and to save charge, in the Refining.

The means of this is in three manners; that is to say, In the Blast of the Fire: In the manner of the Furnace to multiply Heat, by Union and Reflexion: And by some Additament or Medicines, which will help the Bodies to open them the sooner:

Note, the quickning of the Blast, and the multiplying of the Heat in the Furnace, may be the same for all Metals; but the Additaments must be several according to the natures of the Metals.

Note again, That if you think the multiplying of the Additament in the same Proportion that you multiply the Ure, the work will follow, you may be deceived: For quantity in the Passive will add more resistance, then the same quantity in the Active will add force.

For Extracting, you are to enquire what Metals contain others, and likewise what not? As Lead Silver, Copper Silver, &c.

Note, although the charge of Extraction should exceed the worth, yet that is not the matter; For, at least, it will discover Nature and Possibility, the other may be thought on afterwards.

We are likewise to enquire, what the differences are of those Metals, which contain more or less, other Metals; and how that agrees with the poorness or richness of the Metals, or Ure, in themselves: As the Lead, that contains most Silver, is accounted to be more brittle; and yet otherwise poorer in it self.

For Princiipation, I cannot affirm, whether there be any such thing, or no. And, I think; the Chymists make too much ado about it. But howsoever it be, whether Solution or Extraction, or a kinde of Conversion by the Fire, it is diligently to be enquired, What Salts, Sulphur, Vitriol, Mercury, or the like Simple Bodies are to be found in the several Metals; and in what quantity.

THe third Letter of the Cross-Row, is the variation of Metals into several Shapes, Bodies, or Natures; the particulars whereof follow.

Tincture.

Turning to Rust.

Calcination.

Sublimation.

Precipitation.

Amalgamatizing, or turning into a soft Body.

Vitrification.

Opening or Dissolving into Liquor.

Sprouting, or Branching, or Arborecence.

Induration and Mollification.

Making tough or brittle.

Volatility and Fixation.

Transmutation or Version.

For Tincture, it is to be enquired how Metals may be tinted, through and through; and with what, and into what colours: As Tincting-Silver yellow. Tincting-Copper white, and Tincting red, green, blew, especially with keeping the lustre.

Item, Tincture of Glafs.

Item, Tincture of Marble, Flint, or other Stone.

For turning to Rust, two things are chiefly to be enquired: By what Corrosives it is done, and into what colours it turns: As Lead into white, which they call *Serus*; Iron into yellow, which they call *Crocus Martis*: Quick-silver into Vermilion, Brass into green, which they call *Verdegrass*, &c.

For Calcination, to enquire how every Metal is calcined? And into what kinde of Body? And what is the exquisitest way of Calcination?

For Sublimation, to enquire the manner of Subliming; and what Metals endure Subliming; and what Body the Sublimate makes?

For Precipitation likewise, By what strong Waters every Metal will precipitate? or with what Additaments? and in what time? and into what Body?

So for Amalgama, what Metals will endure it? What are the means to do it? And what is the manner of the Body?

For Vitrification likewise, what Metals will endure it? what are the means to do it? into what colour it turns? and further, where the whole
Metal

Metal is turned into Glas? and when the Metal doth but hang in the Glas-
sie part? also what weight the vitrified Body bears, compared with the
crude Body? Also because Vitrification is accounted, a kinde of death of
Metals, what Vitrification will admit, of turning back again, and what
not?

For Dissolution into Liquor, we are to enquire, what is the proper
Menstruum to dissolve any Metal? And in the Negative, what will touch
upon the one, and not upon the other? And what several *Menstrua* will
dissolve any Metal? And which most exactly? *Item*, the process or motion
of the Dissolution? The manner of Rising, Boiling, Vaporizing? More
violent or more gentle? Causing much heat, or less? *Item*, the quan-
tity or charge the Strong-Water will bear, and then give over? *Item*,
the colour into which the Liquor will turn? Above all, it is to be enquired,
whether there be any *Menstruum*, to dissolve any Metal that is not fretting and
corroding; but openeth the Body by sympathy, and not by mordacity or
violent penetration?

For Sprouting or Branching, though it be a thing but transitory, and
a kinde of toy or pleasure; yet there is a more serious use of it: For that it
discovers the delicate motions of spirits, when they put forth, and cannot
get forth, like unto that which is in vegetables.

For Induration or Mollification, it is to be enquired, what will make
Metals harder and harder, and what will make them softer and softer? And
this Enquiry tendeth to two ends;

First, for Use: As to make Iron soft by the Fire, makes it malle-
able.

Secondly, Because Induration is a degree towards Fixation; and
Mollification towards Volatility: And therefore the Inquiry of them, will
give light towards the other.

For tough and brittle, they are much of the same kinde with the
two former, but yet worthy of an Inquiry apart: Especially to joyn
Hardness to Toughness; as making Glas malleable, &c. And
making Blades, strong to resist, and pierce, and yet not easie to
break.

For Volatility and Fixation, it is a principal Branch to be en-
quired. The utmost degree of Fixation is, That whereupon no Fire
will work, nor Strong-water joyned with Fire, if there be any such
Fixation possible: The next is, when Fire simply will not work with-
out Strong-waters: The next is, when it will endure Fire not blow-
ing, or such a strength of Fire: The next is, when it will not endure Fire,
but yet is malleable: The next is, when it is not malleable, but yet it
is not fluent, but stupified. So of Volatility, the utmost degree is,
when it will flee away without returning: The next is, when it will
flee up, but with easie return: The next, when it will flee upwards,
over the Helm, by a kinde of Exufflation, without Vaporizing:

The

The next is, when it will melt, though not rise; And the next, when it will soften, though not melt. Of all these, diligent inquiry is to be made, in several *Metals*; especially of the more extream degrees.

For Transmutation or Version, if it be real and true, it is the furthest point of Art; and would be well distinguished from Extraction, from Restitution, and from Adulteration. I hear much of turning Iron into Copper; I hear also of the growth of Lead in weight, which cannot be without a Conversion of some Body into Lead: But whatsoever is of this kinde, and well approved, is diligently to be inquired, and set down.

THe fourth Letter of the Cross Row, is Restitution. First therefore, it is to be enquired in the Negative; what Bodies will never return, either by reason of their extream fixing, as in some Vitrifications, or by extream Volatility.

It is also to be enquired of the two Means of Reduction; and first by the Fire, which is but by Congregation of Homogeneal parts.

The second is, by drawing them down, by some Body, that hath consent with them: As Iron draweth down Copper in Water; Gold draweth Quick-silver in vapor; whatsoever is of this kinde, is very diligently to be enquired.

Also it is to be enquired, what Time or Age will reduce without the help of Fire or Body?

Also it is to be enquired, what gives Impediment to Union or Restitution, which is sometimes called Mortification; as when Quick-silver is mortified with Turpentine, Spittle, or Butter.

Lastly, it is to be enquired how the Metal restored, differeth in any thing from the Metal raw or crude? As whether it becometh not more churlish, altered in colour, or the like?

THE
BOOK-SELLER
UNTO THE
READER.

T Received some Moneths since these Articles of Enquiry, touching Metals and Minerals, from the hands of the Reverend Dr. Rawley, who hath published several of the Lord Verulams Works since his Death (he having been his Lordships Chaplain) and who hath been careful to Correct at the Press this little Piece (an Addition to the Natural History) according to the Original Copy, remaining amongst his Lordships Manuscripts: Amongst which there is nothing more of that subject to be found, so as no more Additions can be expected.
